

Registry System Testing - Test Specifications

Version 3.1.2024086

Last Updated: 2024-03-26

[GDS Technical Services, Internet Corporation for Assigned Names and Numbers \(ICANN\)](#)

1. Table of Contents

1. [Table of Contents](#)
2. [Change Log](#)
3. ▼ [Preamble](#)
 1. [Test plans](#)
 1. [Test plan types](#)
 2. [Test suites](#)
 3. [Test cases](#)
 1. [Input parameters](#)
 2. [Test environments](#)
 3. [Test results](#)
 4. [General pass/fail criteria](#)
 5. [Error severity levels](#)
 4. [Test procedures](#)
 5. [Test sequence](#)
 6. [Key acronyms and terms](#)
4. ▼ [Test Plans](#)
 1. [Pre-Delegation Test](#)
 2. [RSP Change Test](#)
 3. [DNS RSP Change Test](#)
 4. [Standard IDN Test](#)
 5. [IDN Test \(RSP Evaluation\)](#)
 6. [SRS Gateway Test](#)
 7. [Main RSP Evaluation Test](#)
 8. [DNS RSP Evaluation Test](#)
 9. [DNSSEC RSP Evaluation Test](#)
 10. [SRS Gateway RSP Evaluation Test](#)
 11. [StandardDNS \(OT&E only\)](#)
 12. [StandardDNSSEC \(OT&E only\)](#)
 13. [StandardRDAP \(OT&E only\)](#)
 14. [StandardEPP \(OT&E only\)](#)
 15. [StandardRDE \(OT&E only\)](#)
 16. [StandardSRSGateway \(OT&E only\)](#)
 17. [MinimumRPMs \(OT&E only\)](#)
5. ▼ [Test Suites](#)
 1. [Authoritative DNS Service](#)
 2. [DNS Security Extensions \(DNSSEC\)](#)
 3. [Registration Data Access Protocol \(RDAP\)](#)
 4. [Extensible Provisioning Protocol \(EPP\)](#)
 5. [Registry Data Escrow \(RDE\)](#)
 6. [Internationalized Domain Names \(IDN\)](#)
 7. [SRS Gateway](#)
 8. [DNSSEC Operations](#)
 9. [Minimum Rights Protection Mechanisms \(RPMs\)](#)
 10. [Standard Integration Test](#)
6. ▼ [Resources](#)
 1. [dnssecOps.xfrACL](#)
 2. [epp.clientACL](#)
 3. [epp.clientCSR](#)
 4. [epp.clientCertificate](#)
 5. [epp.tlsCertificateStore](#)
 6. [integration.rdeSFTPACL](#)
 7. [integration.rdeSFTPPublicKey](#)
 8. [rde.encryptionKey](#)

9. [tmch.testCRL](#)
10. [tmch.testCert](#)
11. [tmch.testDNL](#)
12. [tmch.testSMDRL](#)
13. [tmch.testSURL](#)

7. ▼ Test Cases

1. [dns-address01 - Name server address must be globally routable](#)
2. [dns-address02 - Reverse DNS entry exists for name server IP address](#)
3. [dns-address03 - Reverse DNS entry matches name server name](#)
4. [dns-connectivity01 - UDP connectivity to name servers](#)
5. [dns-connectivity02 - TCP connectivity to name servers](#)
6. [dns-connectivity03 - AS Diversity](#)
7. [dns-consistency02 - SOA RNAME consistency](#)
8. [dns-consistency03 - SOA timers consistency](#)
9. [dns-consistency04 - Name server NS consistency](#)
10. [dns-consistency05 - Consistency between glue and authoritative data](#)
11. [dns-consistency06 - SOA MNAME consistency](#)
12. [dns-delegation01 - Minimum number of name servers](#)
13. [dns-delegation02 - Name servers must have distinct IP addresses](#)
14. [dns-delegation03 - No truncation of referrals](#)
15. [dns-delegation04 - Name server is authoritative](#)
16. [dns-delegation05 - Name server must not point at CNAME alias](#)
17. [dns-delegation07 - Parent glue name records present in child](#)
18. [dns-nameserver01 - A name server should not be a recursor](#)
19. [dns-nameserver02 - Test of EDNS0 support](#)
20. [dns-nameserver04 - Same source address](#)
21. [dns-nameserver05 - Behaviour against AAAA query](#)
22. [dns-nameserver06 - NS can be resolved](#)
23. [dns-nameserver08 - Testing QNAME case insensitivity](#)
24. [dns-nameserver09 - Testing QNAME case sensitivity](#)
25. [dns-nameserver10 - Test for undefined EDNS version](#)
26. [dns-nameserver11 - Test for unknown EDNS OPTION-CODE](#)
27. [dns-nameserver12 - Test for unknown EDNS flags](#)
28. [dns-nameserver13 - Test for truncated response on EDNS query](#)
29. [dns-syntax05 - Misuse of '@' character in the SOA RNAME field](#)
30. [dns-syntax06 - No illegal characters in the SOA RNAME field](#)
31. [dns-syntax07 - No illegal characters in the SOA MNAME field](#)
32. [dns-zone07 - SOA master is not an alias](#)
33. [dns-zone10 - No multiple SOA records](#)
34. [dns-zz-idna2008-compliance - IDNA2008 compliance check](#)
35. [dnssec-01 - Legal values for the DS hash digest algorithm](#)
36. [dnssec-02 - DS must match a valid DNSKEY in the child zone](#)
37. [dnssec-03 - Check for too many NSEC3 iterations](#)
38. [dnssec-04 - Check for too short or too long RRSIG lifetimes](#)
39. [dnssec-05 - Check for invalid DNSKEY algorithms](#)
40. [dnssec-06 - Verify DNSSEC additional processing](#)
41. [dnssec-08 - Valid RRSIG for DNSKEY](#)
42. [dnssec-09 - RRSIG\(SOA\) must be valid and created by a valid DNSKEY](#)
43. [dnssec-10 - Zone contains NSEC or NSEC3 records](#)
44. [dnssec-13 - All DNSKEY algorithms used to sign the zone](#)
45. [dnssec-14 - Check for valid RSA DNSKEY key size](#)
46. [dnssec-91 - Permitted signing algorithms](#)
47. [dnssec-92 - Permitted DS record hash algorithm\(s\)](#)
48. [dnssec-93 - NSEC3 iterations check](#)
49. [dnssecOps01-ZSKRollover - ZSK rollover](#)

50. [dnssecOps02-KSKRollover - KSK rollover](#)
51. [dnssecOps03-AlgorithmRollover - algorithm rollover](#)
52. [epp-01 - Service connectivity test](#)
53. [epp-02 - Protocol conformance test](#)
54. [epp-03 - Authentication test](#)
55. [epp-04 - Domain <check> command test](#)
56. [epp-05 - Host <check> command test \(if applicable\)](#)
57. [epp-06 - Contact <check> command test \(if applicable for the registry type\)](#)
58. [epp-07 - Contact <create> command test \(if applicable for the registry type\)](#)
59. [epp-08 - Contact object access control \(if applicable\)](#)
60. [epp-09 - Contact <update> command test \(if applicable for the registry type\)](#)
61. [epp-10 - Contact <delete> command test \(if applicable for the registry type\)](#)
62. [epp-11 - Host <create> command test \(if applicable\)](#)
63. [epp-12 - Host object access control \(if applicable\)](#)
64. [epp-13 - Host <update> command test \(if applicable\)](#)
65. [epp-14 - Domain <create> command test](#)
66. [epp-15 - Registry object integrity test](#)
67. [epp-16 - Domain <update> command test](#)
68. [epp-17 - Service Port consistency test](#)
69. [epp-18 - Domain <renew> command test](#)
70. [epp-19 - Domain <transfer> command test](#)
71. [epp-20 - Domain <transfer> rejection test](#)
72. [epp-21 - Domain <delete> command test](#)
73. [epp-22 - Domain restore test](#)
74. [epp-23 - Host rename test \(if applicable\)](#)
75. [epp-24 - Host <delete> command test \(if applicable\)](#)
76. [idn-01 - Label validation test](#)
77. [idn-02 - Level 1 variant handling test](#)
78. [idn-03 - Level 2 variant handling test](#)
79. [idn-04 - Level 3 variant handling test](#)
80. [integration-01 - EPP -> RDAP Integration Test](#)
81. [integration-02 - EPP -> DNS Integration Test](#)
82. [integration-03 - EPP -> RDE Integration Test](#)
83. [minimumRPMs-01 - Claims <check> command test](#)
84. [minimumRPMs-02 - Sunrise domain/launch application <create> command test](#)
85. [minimumRPMs-03 - Trademark claims domain <create> command test](#)
86. [rdap-01-ipv4Validation - IPv4 address validation](#)
87. [rdap-02-ipv6Validation - IPv6 address validation](#)
88. [rdap-03-domainNameValidation - Domain Name validation](#)
89. [rdap-04-webUriValidation - Web URI validation](#)
90. [rdap-05-domainCaseFoldingValidation - Domain label case folding validation](#)
91. [rdap-06-stdRdapConformanceValidation - RDAP Conformance validation](#)
92. [rdap-07-stdRdapLinksValidation - Links validation](#)
93. [rdap-08-stdRdapNoticesRemarksValidation - Notices and Remarks Validation](#)
94. [rdap-09-stdRdapLanguageIdentifierValidation - Language Identifier Validation](#)
95. [rdap-10-stdRdapEventsValidation - Events Validation](#)
96. [rdap-11-stdRdapStatusValidation - Status validation](#)
97. [rdap-12-stdRdapPort43WhoisServerValidation - Port 43 WHOIS Server](#)
98. [rdap-13-stdRdapPublicIdsValidation - Public IDs validation](#)
99. [rdap-14-stdRdapAsEventActorValidation - asEventActor Validation](#)
100. [rdap-15-stdRdapIpAddressesValidation - IP Addresses Validation](#)
101. [rdap-16-stdRdapVariantsValidation - Variants validation](#)
102. [rdap-17-stdRdapUnicodeNameValidation - Unicode name](#)
103. [rdap-18-stdRdapLdhNameValidation - LDH name](#)
104. [rdap-19-stdRdapRolesValidation - Roles validation](#)

105. [rdap-20-stdRdapEntitiesValidation - Entities validation](#)
106. [rdap-21-stdRdapSecureDnsValidation - Secure DNS validation](#)
107. [rdap-22-stdRdapErrorResponseBodyValidation - Error Response Body](#)
108. [rdap-23-stdRdapDomainLookupValidation - Domain Lookup Validation](#)
109. [rdap-24-stdRdapEntityLookupValidation - Entity lookup validation](#)
110. [rdap-25-stdRdapNameserverLookupValidation - Nameserver lookup validation](#)
111. [rdap-26-stdRdapHelpValidation - Help validation](#)
112. [rdap-27-stdRdapNameserversSearchValidation - Nameservers search validation](#)
113. [rdap-91 - TLS version conformance check](#)
114. [rdap-92 - Service port consistency check](#)
115. [rde-01 - validate deposit filename format](#)
116. [rde-02 - validate signature over deposit file](#)
117. [rde-03 - decrypt deposit file\(s\)](#)
118. [rde-04 - validate XML/CSV](#)
119. [rde-05 - validate object types](#)
120. [rde-06 - validate object counts](#)
121. [rde-07 - validate domain objects](#)
122. [rde-08 - validate host objects \(if applicable\)](#)
123. [rde-09 - validate contact objects \(if applicable\)](#)
124. [rde-10 - validate registrar objects](#)
125. [rde-11 - validate IDN table objects \(if applicable\)](#)
126. [rde-12 - validate NNDN objects](#)
127. [rde-13 - validate EPP parameters object](#)
128. [rde-14 - validate policy object \(if applicable\)](#)
129. [srsgw-01 - IPv4 and IPv6 connectivity](#)
130. [srsgw-02 - Host <create> synchronization \(if applicable\)](#)
131. [srsgw-03 - Contact <create> synchronization \(if applicable\)](#)
132. [srsgw-04 - Domain <create> synchronization](#)
133. [srsgw-05 - Domain <renew> synchronisation](#)
134. [srsgw-06 - Domain <transfer> synchronisation](#)
135. [srsgw-07 - Domain <transfer> approval synchronisation](#)
136. [srsgw-08 - Domain <delete> synchronisation](#)
137. [srsgw-09 - Host <update> synchronization \(if applicable\)](#)
138. [srsgw-10 - Host <delete> synchronization \(if applicable\)](#)
139. [srsgw-11 - Contact <update> synchronization \(if applicable\)](#)
140. [srsgw-12 - Contact <delete> synchronization \(if applicable\)](#)
141. [srsgw-13 - Domain RDAP synchronization](#)
142. [srsgw-14 - Nameserver RDAP synchronization](#)
143. [srsgw-15 - Registrar RDAP synchronization](#)

8. ▼ Input Parameters

1. [dns.nameservers \(input\)](#)
2. [dnssec.dsRecords \(input\)](#)
3. [dnssecOps.algorithmRolloverZone \(input\)](#)
4. [dnssecOps.csk \(input\)](#)
5. [dnssecOps.kskRolloverZone \(input\)](#)
6. [dnssecOps.nameservers \(input\)](#)
7. [dnssecOps.primaryServers \(input\)](#)
8. [dnssecOps.tsigKey \(input\)](#)
9. [dnssecOps.zskRolloverZone \(input\)](#)
10. [epp.cid01 \(input\)](#)
11. [epp.cid01DataModel \(input\)](#)
12. [epp.cid02 \(input\)](#)
13. [epp.cid02DataModel \(input\)](#)
14. [epp.greeting \(file\)](#)
15. [epp.hostModel \(input\)](#)

16. [epp.hostName_\(input\)](#)
17. [epp.pwd01_\(input\)](#)
18. [epp.pwd02_\(input\)](#)
19. [epp.registeredContacts_\(input\)](#)
20. [epp.registeredNames_\(input\)](#)
21. [epp.registeredNameservers_\(input\)](#)
22. [epp.requiredContactTypes_\(input\)](#)
23. [epp.restoreReportRequired_\(input\)](#)
24. [epp.secDNSInterfaces_\(input\)](#)
25. [epp.serverIssuedClientCertificate01_\(file\)](#)
26. [epp.serverIssuedClientCertificate02_\(file\)](#)
27. [general.registryDataModel_\(input\)](#)
28. [integration.rdeSFTPDirectory_\(input\)](#)
29. [integration.rdeSFTPHostname_\(input\)](#)
30. [integration.rdeSFTPUsername_\(input\)](#)
31. [integration.rriACL_\(input\)](#)
32. [minimumRPMS.claimsTLD_\(input\)](#)
33. [minimumRPMS.sunriseModels_\(input\)](#)
34. [minimumRPMS.sunriseTLD_\(input\)](#)
35. [rdap.baseURLs_\(input\)](#)
36. [rdap.testDomains_\(input\)](#)
37. [rdap.testEntities_\(input\)](#)
38. [rdap.testNameservers_\(input\)](#)
39. [rde.depositFile_\(file\)](#)
40. [rde.publicKey_\(file\)](#)
41. [rde.signatureFile_\(file\)](#)
42. [srgw.eppClid01_\(input\)](#)
43. [srgw.eppClid02_\(input\)](#)
44. [srgw.eppHostName_\(input\)](#)
45. [srgw.eppPwd01_\(input\)](#)
46. [srgw.eppPwd02_\(input\)](#)
47. [srgw.rdapBaseURLs_\(input\)](#)
48. [srgw.serverIssuedClientCertificate01_\(file\)](#)
49. [srgw.serverIssuedClientCertificate02_\(file\)](#)

9. ▼ Errors

1. [DNSSEC_DNS_QUERY_ERROR\(ERROR\)](#)
2. [DNSSEC_INVALID_DIGEST_ALGORITHM\(ERROR\)](#)
3. [DNSSEC_INVALID_SIGNING_ALGORITHM\(ERROR\)](#)
4. [DNSSEC_NSEC3_ITERATIONS_IS_NOT_ZERO\(ERROR\)](#)
5. [DNSSEC_NSEC3_SALT_IS_NOT_EMPTY\(ERROR\)](#)
6. [DNSSEC_OPS_ALGORITHM_ROLLOVER_CHAIN_OF_TRUST_BROKEN\(ERROR\)](#)
7. [DNSSEC_OPS_ALGORITHM_ROLLOVER_NOT_COMPLETED\(ERROR\)](#)
8. [DNSSEC_OPS_DNS_QUERY_FAILED_TOO_MANY_TIMES\(ERROR\)](#)
9. [DNSSEC_OPS_INVALID_ALGORITHM\(ERROR\)](#)
10. [DNSSEC_OPS_KSK_ROLLOVER_CHAIN_OF_TRUST_BROKEN\(ERROR\)](#)
11. [DNSSEC_OPS_KSK_ROLLOVER_NOT_COMPLETED\(ERROR\)](#)
12. [DNSSEC_OPS_XFR_FAILED_TOO_MANY_TIMES\(ERROR\)](#)
13. [DNSSEC_OPS_ZONE_IS_INVALID\(CRITICAL\)](#)
14. [DNSSEC_OPS_ZSK_ROLLOVER_CHAIN_OF_TRUST_BROKEN\(ERROR\)](#)
15. [DNSSEC_OPS_ZSK_ROLLOVER_NOT_COMPLETED\(ERROR\)](#)
16. [DNS_IDNA2008_INVALID_MNAME\(ERROR\)](#)

10. [About this document](#)

2. Change Log

2.1. Tuesday, March 26, 2024

1. This is the final release of the test specifications before the start of the Public Comment. No changes to the specification will be published until after the Public Comment process has been completed.
 2. Since the [Registration Data Policy](#) allows for different registry data models to apply to different registrar accounts (depending on whether or not there is an appropriate legal basis, and data processing agreement is in place), the `general.minimalPublicDataSet` input parameter has been replaced with `general.registryDataModel`, which is an enum. To support this, the `epp.clid01DataModel` and `epp.clid02DataModel` input parameters have been added, so that different registry data models can be specified for each registrar account.
 3. The algorithm mnemonics that can be specified in the `dnssecOps.tsigKey` input parameter have been restricted to those that are (a) applicable for DNS and (b) secure.
 4. Error messages extracted from Zonemaster now include the tag descriptions from `Zonemaster::Engine`.
 5. In [minimumRPMs-03](#), the maximum time period between when the trademark claim notice acknowledgement and the submission of the domain <create> command has been increased from 48 hours to one year. The maturity of this test has been changed to BETA.
 6. Case maturity metrics: ALPHA 0% (-1%), BETA 0% (-50%), GAMMA 100% (+50%).
-

2.2. Wednesday, March 20, 2024

1. clarified the elements that will be tested in [epp-07](#).
 2. added Configuration section to the YAML file which holds internal test system configuration parameters.
 3. Case maturity metrics: ALPHA <1% (no change), BETA 50% (no change), GAMMA 50% (no change)
-

2.3. Wednesday, March 13, 2024

1. Added a number of new errors to [epp-07](#).
 2. In [rde-07](#), clarify that a domain with the pendingDelete status can have an <exDate> element that is before the watermark.
 3. Case maturity metrics: ALPHA <1% (no change), BETA 50% (no change), GAMMA 50% (no change)
-

2.4. Wednesday, February 28, 2024

1. Added the [EPP_GREETING_MISSING_EN_LANG](#) error to [epp-02](#). The circumstances under which the [EPP_GREETING_RECOMMENDED_EXTENSION_MISSING](#) warning will be produced have been clarified.
 2. Various changes to input parameter schema to address issues with OpenAPI code generators not being able to support various JSON Schema features.
 3. The [dnssecOps.primaryServer](#) input parameter has been changed to an array to allow for multiple servers to be specified.
 4. Documented the [test sequence](#).
 5. In order to simplify the specifications and avoid confusion, inter-case dependencies have been removed from the HTML representation.
 6. Added the [DNS_INCONSISTENT_RESPONSES](#) to all test cases in the [DNS](#) and [DNSSEC](#) suites.
 7. Upgraded the [ZM_RNAME_MISUSED_AT_SIGN](#) and [ZM_DIFFERENT_SOURCE_IP](#) errors to ERROR.
 8. Case maturity metrics: ALPHA <1% (no change), BETA 50% (no change), GAMMA 50% (no change)
-

2.5. Wednesday, February 21, 2024

1. The [ZM_NAMESERVER_IP_PRIVATE_NETWORK](#) error now has CRITICAL severity.
 2. The suites that use an Input Parameter are now listed, in addition to any test cases.
 3. All cases in the [Minimum RPMs](#) suite are now at BETA maturity, except for [minimumRPMs-03](#), which may change due to anticipated changes to the Trademark Claims policy.
 4. All cases in the [DNSSEC Operations](#) suite are now at BETA maturity.
 5. Clarified wording of the [DNSSEC Operations](#) test cases and added configuration guidance for applicants.
 6. Any DNS query or XFR that fails during the [DNSSEC Operations](#) suite is now an error.
 7. Added the [epp.tlsCertificateStore](#) resource to [rdap-91](#).
 8. Added new test plans that will only be available in OT&E, to allow testing of specific test suites.
 9. Added the OTE-Only property to test plan objects indicating the above, and bumped the schema version accordingly.
 10. All error messages are now documented.
 11. Case maturity metrics: ALPHA <1% (-5%), BETA 50% (+7%), GAMMA 50% (+0%)
-

2.6. Wednesday, February 14, 2024

1. Links to references and notes about upgraded message severities in Zonemaster cases have been fixed.
 2. the [epp.greeting](#) input parameter is now a file upload.
 3. added schemas to all input parameters that didn't have them.
 4. Case maturity metrics: ALPHA 7% (+2%), BETA 43% (-14%), GAMMA 50% (+12%)
-

2.7. Wednesday, February 7, 2024

1. Zonemaster cases are now generated directly from [Zonemaster::Engine](#), so now include all possible error messages.
 2. Rather than placing “common” errors at the suite level, each case now lists all the errors it may emit. In the HTML output, the cases that may emit an error are listed for each error.
 3. Began providing descriptions of errors, and adjusting their severity levels accordingly.
 4. Protocol-related errors are now standardised, so for example, the SRSGW and IDN cases use the same errors as the EPP cases, for EPP-related errors.
 5. The way that the specification version is calculated has changed to accommodate the new release process (now that the repository has multiple branches, counting commits can result in two files having the same version).
 6. Case maturity metrics: ALPHA 5% (-2%), BETA 57% (-17%), GAMMA 38% (+19%)
-

2.8. Wednesday, January 31, 2024

1. Added this ChangeLog.
 2. Add content of NS records to the list of names checked in [dns-zz-idna2008-compliance](#).
 3. Add [dnssec-93](#) test case.
 4. Remove the dnssec-12, dnssec-15, dnssec-16, dnssec-17 and dnssec-18 test cases.
 5. The [ZM_ALGORITHM_NOT_RECOMMENDED](#) error raised by [dnssec-05](#) is now an **ERROR**.
 6. The maturity of all cases in the [EPP suite](#) has been raised to **BETA**.
 7. Added additional error codes to [epp-16](#).
 8. Added check for transferPeriod RGP status to [epp-19](#).
 9. Add [epp-25](#) test case.
 10. Case maturity metrics: ALPHA 7% , BETA 74%, GAMMA 19%
-

3. Preamble

This file describes each test [plan](#), [suite](#) and [case](#) in the RST service, as well as the [input parameters](#) required for each; relevant [resources](#); and the [errors](#) that may occur during testing.

The key words “MUST”, “MUST NOT”, “REQUIRED”, “SHALL”, “SHALL NOT”, “SHOULD”, “SHOULD NOT”, “RECOMMENDED”, “NOT RECOMMENDED”, “MAY”, and “OPTIONAL” in this document are to be interpreted as described in [RFC 2119](#) when, and only when, they appear in all capitals, as shown here.

2.1. Test plans

An individual *Test Plan* addresses a particular scenario (for example, RSP evaluation or Pre-Delegation Testing). Each plan consists of one or more *test suites*, which in turn include one or more *test cases*.

2.1.1. Test plan types

There are two types of test plan described in this document:

- “**Business as usual**” plans, which are used as part of the lifecycle of a gTLD (e.g., Pre-Delegation Test, RSP/DNS RSP change Test, IDN Test, SRS Gateway Test);
- **RSP evaluation** plans, which are used as part of the [RSP evaluation program](#).

2.2. Test suites

A *Test Suite* is a collection of *test cases* with a common theme or subject matter, for example, Authoritative DNS or Registry Data Escrow.

2.3. Test cases

A *Test Case* describes a process for determining the conformance or acceptability of a certain element of the system.

A test case consists of a *test procedure* that accepts zero or more **input parameters**, and generates one or more **test results**.

2.3.1. Input parameters

All test cases require some information about the subject of the test, for example, service hostnames, credentials, and functional parameters. These *input parameters* may be shared across multiple test cases.

2.3.2. Test environments

Each test plan indicates whether the test is to be carried out in the production environment, or whether a test, staging or Operational Testing and Evaluation (OT&E) environment may be used. In general, test plans which are designed for “business as usual” use during the lifecycle of a TLD **MUST** be carried out in the production registry infrastructure, while RSP evaluation tests **MAY** be carried out in test, staging or OT&E environments.

2.3.3. Test results

Test cases will generate one or more *test results*. Test results indicate the outcome of the test and other relevant information.

2.3.4. General pass/fail criteria

In general, for a test to pass, **all** the test cases specified in the test suite(s) for the test plan **MUST** pass: if *any* fail, then the test as a whole will fail.

A test case will fail if it produces one or more [errors](#) with the **ERROR** or **CRITICAL** severities.

2.3.5. Error severity levels

The supported severity levels are a subset of the values defined in RFC 5424.

2. WARNING - an issue which does not prevent the test from *passing*, but which may benefit from further investigation.
3. ERROR - an issue which prevents the test case from *passing*, but does not prevent the test case from *continuing*. A test case may produce multiple ERROR results.
4. CRITICAL - an issue which prevents the test case from continuing any further. A test case will only produce a single CRITICAL result and it will always be the last result in the log.

2.4. Test procedures

Where possible, test cases will reuse existing connections and any objects created as part of previous test cases, to reduce the resources required to perform service testing. However, it is anticipated that registry services will see a moderate volume of connections from test systems, and a moderate number of objects may be created as part of the test. The level of resource consumption is anticipated to be significantly lower than that experienced by a live production system, so in “business as usual” scenarios, where production systems are being tested, no impact to those systems is expected.

Where a test is being carried out using test, staging or OT&E environments, then those systems should be provisioned with sufficient capacity to allow testing to be carried out without interruption. Any existing OT&E environment supporting registrar integration testing and onboarding is likely to be sufficiently robust to support Registry System Testing with no further additional capacity requirements.

2.5. Test sequence

The test system will generate a linear *test sequence* based on the test suite(s) and test case(s) used by the specified test plan. The test cases will be sorted in canonical alphanumeric order and executed in that order.

If a test case produces any ERROR or CRITICAL messages, the test run will stop at that point.

Future versions may optimize the test sequence using knowledge of intercase dependencies to allow certain parts of the sequence to be run in parallel.

2.6. Key acronyms and terms

RST:

Registry System Testing. This system.

PDT:

Pre-Delegation Test. A test carried out prior to the delegation of a new TLD into the DNS root zone.

RSP:

Registry Service Provider. A specialist provider of critical registry services.

DNS:

Domain Name System. The Internet’s system of globally unique identifiers.

TLD:

Top-level domain. The highest level of the DNS namespace hierarchy.

gTLD:

generic top-level domain.

DNSSEC:

DNS Security Extensions. DNSSEC is described in [BCP 237](#).

EPP:

Extensible Provisioning Protocol. The protocol used by registrars to create and manage domain name registrations in an SRS. EPP is defined in [STD 69](#).

SRS:

Shared Registry System. A TLD registry in which registrations are managed by one or more registrars, using EPP.

RDDS:

Registration Data Directory Services. A service to provide access to data about domain registrations to third parties.

RDAP:

Registration Data Access Protocol. The protocol used to deliver the RDDS. RDAP is defined in [STD 95](#).

RDE:

Registry Data Escrow. A system whereby the registration data stored in a Shared Registry System is backed up to a trusted third party. RDE is defined in [RFC 8909](#) and [RFC 9022](#).

IDN:

Internationalized Domain Name. A domain name that contains characters not in the ASCII character set. The technical specification for IDNs may be found in [RFC 5890](#). All gTLDs must comply with ICANN's [IDN Guidelines](#).

LGR:

Label Generation Ruleset. The rules by which IDNs are validated. LGRs are described in [RFC 7940](#).

RO:

Registry Operator. The entity to which ICANN has granted the right to operate a gTLD.

RA:

Registry Agreement. The contract between a Registry Operator and ICANN. The base Registry Agreement may be reviewed at <https://www.icann.org/en/registry-agreements/base-agreement>.

KSK:

Key Signing Key. A cryptographic key that serves as the Secure Entry Point for a DNS zone, and which signs a DNS zone's ZSKs. A digest of this key is published in the parent zone (ie. the root zone for a TLD).

ZSK:

Zone Signing Key. A cryptographic key that signs a DNS zone's resource records.

CSK:

Combined Signing Key. A cryptographic key used as **both** a KSK and a ZSK.

RPMs:

Rights Protection Mechanisms, intended to discourage or prevent registration of domain names that violate or abuse another party's legal rights. These **MUST** include (but are not limited to): (1) Sunrise Periods, and (2) Trademark Claims Periods (see [Specification 7 of the Registry Agreement](#)).

TMCH:

Trademark Clearinghouse. The system used by ICANN to maintain a database of validated and registered trademarks which is used to enforce Rights Protection Mechanisms (RPMs) in gTLDs. The functional specifications of the TMCH are defined in [RFC 9361](#).

SLA:

Service Level Agreement. The registry performance specifications laid out in [Specification 10 of the Registry Agreement](#).

RRI:

Registration Reporting Interfaces. The interfaces provided by ICANN to contracted parties including Registry Operators to fulfill and monitor their applicable reporting requirements, including per-registrar transaction reports; registry functions activity reports; data escrow deposits reports and data escrow deposits notifications. For registry operators, the relevant interfaces are defined in [draft-lozano-icann-registry-interfaces](#).

4. Test Plans

4.1. Pre-Delegation Test

4.1.1. Description

The purpose of the Pre-Delegation Test is to verify that the applicant has met its commitment to establish registry operations in accordance with the technical and operational criteria described in the gTLD Applicant Guidebook (AGB). Each applicant will be required to complete PDT as a prerequisite to delegation into the root zone.

The Pre-Delegation Test covers all critical registry services and IDNs, and therefore uses all standard test suites.

Note on test environment: this is a “business as usual” test, designed to test a soon-to-be or already delegated TLD. Therefore, all input parameters provided **MUST** relate to the production registry environment.

Pass/fail criteria

As with all other [test plans](#), for this test to pass, **all** the listed test cases **MUST** pass: if **any** fail, then the test as a whole will fail.

▼ 4.1.2. Plan ID

The following Test Plan ID may be used with the RST API:

StandardPreDelegationTest

▼ 4.1.3. Test suites

This plan uses the following test suites:

1. [Authoritative DNS Service](#)
2. [DNS Security Extensions \(DNSSEC\)](#)
3. [Registration Data Access Protocol \(RDAP\)](#)
4. [Extensible Provisioning Protocol \(EPP\)](#)
5. [Registry Data Escrow \(RDE\)](#)
6. [Internationalized Domain Names \(IDN\)](#)
7. [Standard Integration Test](#)

▼ 4.1.4. Resources

The following resources may be required to prepare for this test plan:

- [epp.clientACL](#)
- [epp.clientCSR](#)
- [epp.clientCertificate](#)
- [epp.tlsCertificateStore](#)
- [integration.rdeSFTPACL](#)
- [integration.rdeSFTPPublicKey](#)
- [rde.encryptionKey](#)

▼ 4.1.5. Errors

This test plan may produce the following errors:

- [DNSSEC_DNS_QUERY_ERROR\(ERROR\)](#)
- [DNSSEC_INVALID_DIGEST_ALGORITHM\(ERROR\)](#)
- [DNSSEC_INVALID_SIGNING_ALGORITHM\(ERROR\)](#)
- [DNSSEC_NSEC3_ITERATIONS_IS_NOT_ZERO\(ERROR\)](#)
- [DNSSEC_NSEC3_SALT_IS_NOT_EMPTY\(ERROR\)](#)
- [DNS_IDNA2008_INVALID_MNAME\(ERROR\)](#)
- [DNS_IDNA2008_INVALID_NS_NSNAME\(ERROR\)](#)

- [DNS_IDNA2008_INVALID_RNAME\(ERROR\)](#)
- [DNS_IDNA2008_QUERY_FAILED\(CRITICAL\)](#)
- [DNS_INCONSISTENT_RESPONSES\(ERROR\)](#)
- [EPP_CONTACT_CHECK_INVALID_CONTACT_ID_INCORRECT_AVAIL\(ERROR\)](#)
- [EPP_CONTACT_CHECK_REGISTERED_CONTACT_ID_INCORRECT_AVAIL\(ERROR\)](#)
- [EPP_CONTACT_CHECK_VALID_CONTACT_ID_INCORRECT_AVAIL\(ERROR\)](#)
- [EPP_CONTACT_CREATE_INFO_RESPONSE_MISSING_OR_INCORRECT_CC\(ERROR\)](#)
- [EPP_CONTACT_CREATE_INFO_RESPONSE_MISSING_OR_INCORRECT_CITY\(ERROR\)](#)
- [EPP_CONTACT_CREATE_INFO_RESPONSE_MISSING_OR_INCORRECT_EMAIL\(ERROR\)](#)
- [EPP_CONTACT_CREATE_INFO_RESPONSE_MISSING_OR_INCORRECT_ID\(ERROR\)](#)
- [EPP_CONTACT_CREATE_INFO_RESPONSE_MISSING_OR_INCORRECT_NAME\(ERROR\)](#)
- [EPP_CONTACT_CREATE_INFO_RESPONSE_MISSING_OR_INCORRECT_ORG\(ERROR\)](#)
- [EPP_CONTACT_CREATE_INFO_RESPONSE_MISSING_OR_INCORRECT_PC\(ERROR\)](#)
- [EPP_CONTACT_CREATE_INFO_RESPONSE_MISSING_OR_INCORRECT_POSTALINFO_TYPE\(ERROR\)](#)
- [EPP_CONTACT_CREATE_INFO_RESPONSE_MISSING_OR_INCORRECT_SP\(ERROR\)](#)
- [EPP_CONTACT_CREATE_INFO_RESPONSE_MISSING_OR_INCORRECT_STREET\(ERROR\)](#)
- [EPP_CONTACT_CREATE_INFO_RESPONSE_MISSING_OR_INCORRECT_VOICE\(ERROR\)](#)
- [EPP_CONTACT_CREATE_INFO_RESPONSE_NOT_1000\(ERROR\)](#)
- [EPP_CONTACT_CREATE_SERVER_ACCEPTS_EMPTY_CC\(ERROR\)](#)
- [EPP_CONTACT_CREATE_SERVER_ACCEPTS_EMPTY_CITY\(ERROR\)](#)
- [EPP_CONTACT_CREATE_SERVER_ACCEPTS_EMPTY_EMAIL\(ERROR\)](#)
- [EPP_CONTACT_CREATE_SERVER_ACCEPTS_EMPTY_NAME\(ERROR\)](#)
- [EPP_CONTACT_CREATE_SERVER_ACCEPTS_EMPTY_STREET\(ERROR\)](#)
- [EPP_CONTACT_CREATE_SERVER_ACCEPTS_EMPTY_VOICE\(ERROR\)](#)
- [EPP_CONTACT_CREATE_SERVER_ACCEPTS_INVALID_CC\(ERROR\)](#)
- [EPP_CONTACT_CREATE_SERVER_ACCEPTS_INVALID_CITY\(ERROR\)](#)
- [EPP_CONTACT_CREATE_SERVER_ACCEPTS_INVALID_EMAIL\(ERROR\)](#)
- [EPP_CONTACT_CREATE_SERVER_ACCEPTS_INVALID_ID\(ERROR\)](#)
- [EPP_CONTACT_CREATE_SERVER_ACCEPTS_INVALID_NAME\(ERROR\)](#)
- [EPP_CONTACT_CREATE_SERVER_ACCEPTS_INVALID_ORG\(ERROR\)](#)
- [EPP_CONTACT_CREATE_SERVER_ACCEPTS_INVALID_POSTALINFO_TYPE\(ERROR\)](#)
- [EPP_CONTACT_CREATE_SERVER_ACCEPTS_INVALID_STREET\(ERROR\)](#)
- [EPP_CONTACT_CREATE_SERVER_ACCEPTS_INVALID_VOICE\(ERROR\)](#)
- [EPP_CONTACT_DELETE_OBJECT_STILL_EXISTS\(ERROR\)](#)
- [EPP_CONTACT_DELETE_RESPONSE_NOT_1000_OR_1001\(ERROR\)](#)
- [EPP_CONTACT_INFO_RESPONSE_NOT_2201\(ERROR\)](#)
- [EPP_CONTACT_UPDATE_INFO_RESPONSE_MISSING_OR_INCORRECT_CC\(ERROR\)](#)
- [EPP_CONTACT_UPDATE_INFO_RESPONSE_MISSING_OR_INCORRECT_CITY\(ERROR\)](#)
- [EPP_CONTACT_UPDATE_INFO_RESPONSE_MISSING_OR_INCORRECT_EMAIL\(ERROR\)](#)
- [EPP_CONTACT_UPDATE_INFO_RESPONSE_MISSING_OR_INCORRECT_ID\(ERROR\)](#)

▼ 4.1.6. Input parameters

This plan requires the following input parameters:

- [dns.nameservers \(input\)](#)
- [dnssec.dsRecords \(input\)](#)
- [epp.clid01 \(input\)](#)
- [epp.clid01DataModel \(input\)](#)
- [epp.clid02 \(input\)](#)
- [epp.clid02DataModel \(input\)](#)

- [epp.greeting_\(file\)](#)
- [epp.hostModel_\(input\)](#)
- [epp.hostName_\(input\)](#)
- [epp.pwd01_\(input\)](#)
- [epp.pwd02_\(input\)](#)
- [epp.registeredContacts_\(input\)](#)
- [epp.registeredNames_\(input\)](#)
- [epp.registeredNameservers_\(input\)](#)
- [epp.requiredContactTypes_\(input\)](#)
- [epp.restoreReportRequired_\(input\)](#)
- [epp.secDNSInterfaces_\(input\)](#)
- [epp.serverIssuedClientCertificate01_\(file\)](#)
- [epp.serverIssuedClientCertificate02_\(file\)](#)
- [general.registryDataModel_\(input\)](#)
- [integration.rdeSFTPDirectory_\(input\)](#)
- [integration.rdeSFTPHostname_\(input\)](#)
- [integration.rdeSFTPUsername_\(input\)](#)
- [integration.rriACL_\(input\)](#)
- [rdap.baseURLs_\(input\)](#)
- [rdap.testDomains_\(input\)](#)
- [rdap.testEntities_\(input\)](#)
- [rdap.testNameservers_\(input\)](#)
- [rde.depositFile_\(file\)](#)
- [rde.publicKey_\(file\)](#)
- [rde.signatureFile_\(file\)](#)

▼ 4.1.7. Required files

- [epp.greeting](#)
- [epp.serverIssuedClientCertificate01](#)
- [epp.serverIssuedClientCertificate02](#)
- [rde.depositFile](#)
- [rde.publicKey](#)
- [rde.signatureFile](#)

4.2. RSP Change Test

4.2.1. Description

A Registry Operator may apply to ICANN to change a Material Subcontracting Arrangement (MSA) and appoint a new Registry Services Provider. Before this change can be approved, the new RSP **MUST** complete Registry System Testing to ensure their systems comply with the technical and operational requirements of the Registry Agreement.

The RSP Change Test covers all critical registry services and IDNs, and therefore uses all test standard suites.

Note on test environment: this is a “business as usual” test, designed to test a soon-to-be or already delegated TLD. Therefore, all input parameters provided **MUST** relate to the production registry environment.

Pass/fail criteria

As with all other [test plans](#), for this test to pass, **all** the listed test cases **MUST** pass: if **any** fail, then the test as a whole will fail.

▼ 4.2.2. Plan ID

The following Test Plan ID may be used with the RST API:

StandardRSPChangeTest

▼ 4.2.3. Test suites

This plan uses the following test suites:

1. [Authoritative DNS Service](#)
2. [DNS Security Extensions \(DNSSEC\)](#)
3. [Registration Data Access Protocol \(RDAP\)](#)
4. [Extensible Provisioning Protocol \(EPP\)](#)
5. [Registry Data Escrow \(RDE\)](#)
6. [Internationalized Domain Names \(IDN\)](#)
7. [Standard Integration Test](#)

▼ 4.2.4. Resources

The following resources may be required to prepare for this test plan:

- [epp.clientACL](#)
- [epp.clientCSR](#)
- [epp.clientCertificate](#)
- [epp.tlsCertificateStore](#)
- [integration.rdeSFTPACL](#)
- [integration.rdeSFTPPublicKey](#)
- [rde.encryptionKey](#)

▼ 4.2.5. Errors

This test plan may produce the following errors:

- [DNSSEC DNS QUERY ERROR \(ERROR\)](#)
- [DNSSEC INVALID DIGEST ALGORITHM \(ERROR\)](#)
- [DNSSEC INVALID SIGNING ALGORITHM \(ERROR\)](#)
- [DNSSEC NSEC3 ITERATIONS IS NOT ZERO \(ERROR\)](#)
- [DNSSEC NSEC3 SALT IS NOT EMPTY \(ERROR\)](#)
- [DNS_IDNA2008_INVALID_MNAME \(ERROR\)](#)
- [DNS_IDNA2008_INVALID_NS_NSDNAME \(ERROR\)](#)
- [DNS_IDNA2008_INVALID_RNAME \(ERROR\)](#)

4.3. DNS RSP Change Test

4.3.1. Description

A Registry Operator may apply to ICANN to change a Material Subcontracting Arrangement (MSA) and appoint a new provider of authoritative DNS services instead of or in addition to any existing provider(s).

Before this change can be approved, the new DNS provider **MUST** complete testing to ensure their systems comply with the technical and operational requirements of the Registry Agreement.

The DNS RSP Change Test uses the DNS test suite only.

Note on test environment: this is a “business as usual” test, designed to test a soon-to-be or already delegated TLD. Therefore, all input parameters provided **MUST** relate to the production registry environment.

Pass/fail criteria

As with all other [test plans](#), for this test to pass, **all** the listed test cases **MUST** pass: if **any** fail, then the test as a whole will fail.

▼ 4.3.2. Plan ID

The following Test Plan ID may be used with the RST API:

DNSRSPChangeTest

▼ 4.3.3. Test suites

This plan uses the following test suites:

1. [Authoritative DNS Service](#)
2. [DNS Security Extensions \(DNSSEC\)](#)

▼ 4.3.4. Resources

The following resources may be required to prepare for this test plan:

- *None specified.*

▼ 4.3.5. Errors

This test plan may produce the following errors:

- [DNSSEC_DNS_QUERY_ERROR \(ERROR\)](#)
- [DNSSEC_INVALID_DIGEST_ALGORITHM \(ERROR\)](#)
- [DNSSEC_INVALID_SIGNING_ALGORITHM \(ERROR\)](#)
- [DNSSEC_NSEC3_ITERATIONS_IS_NOT_ZERO \(ERROR\)](#)

```

4.4. Standard IDN Test

4.4.1. Description

A Registry Operator may apply to ICANN to amend its Registry Agreement to offer new scripts and/or languages for Internationalized Domain Names.

The purpose of an IDN RST test is to verify that the Registry Operator's registry system handles IDN registrations in accordance with the submitted policy statements and IDN tables.

The IDN Test uses the IDN test suite only.

Note on test environment: this is a “business as usual” test, designed to test a soon-to-be or already delegated TLD. Therefore, all input parameters provided **MUST** relate to the production registry environment.

Pass/fail criteria

As with all other [test plans](#), for this test to pass, **all** the listed test cases **MUST** pass: if **any** fail, then the test as a whole will fail.

▼ 4.4.2. Plan ID

The following Test Plan ID may be used with the RST API:

StandardIDNTest

▼ 4.4.3. Test suites

This plan uses the following test suites:

1. [Internationalized Domain Names \(IDN\)](#)

▼ 4.4.4. Resources

The following resources may be required to prepare for this test plan:

- [epp.clientACL](#)
- [epp.clientCSR](#)
- [epp.clientCertificate](#)

▼ 4.4.5. Errors

This test plan may produce the following errors:

- [EPP_DNS_RESOLUTION_ERROR \(CRITICAL\)](#)
- [EPP_LOGIN_ERROR \(CRITICAL\)](#)
- [EPP_NO_SERVICE_PORTS_REACHABLE \(CRITICAL\)](#)
- [EPP_SCHEMA_VALIDATION_ERROR \(ERROR\)](#)
- [EPP_SERVICE_PORT_UNREACHABLE \(WARNING\)](#)
- [EPP_TLS_CONNECTION_ERROR \(ERROR\)](#)
- [EPP_XML_PARSE_ERROR \(ERROR\)](#)
- [IDN_SERVER_ACCEPTS_INVALID_LABEL \(ERROR\)](#)
- [IDN_SERVER_REJECTS_VALID_LABEL \(ERROR\)](#)
- [IDN_VARIANT_LABEL_NOT_BLOCKED \(ERROR\)](#)
- [IDN_VARIANT_SERVER_ACCEPTS_VARIANT_CREATE_FROM_INCORRECT_REGISTRAR \(ERROR\)](#)
- [IDN_VARIANT_SERVER_ACCEPTS_VARIANT_CREATE_WITH_INCORRECT_REGISTRANT \(ERROR\)](#)
- [IDN_VARIANT_SERVER_REJECTS_VARIANT_CREATE_FROM_SAME_REGISTRAR \(ERROR\)](#)
- [IDN_VARIANT_SERVER_REJECTS_VARIANT_CREATE_WITH_SAME_REGISTRANT \(ERROR\)](#)

▼ 4.4.6. Input parameters

This plan requires the following input parameters:

- [epp.cid01 \(input\)](#)
- [epp.cid01DataModel \(input\)](#)
- [epp.cid02 \(input\)](#)
- [epp.cid02DataModel \(input\)](#)
- [epp.hostModel \(input\)](#)
- [epp.hostName \(input\)](#)
- [epp.pwd01 \(input\)](#)
- [epp.pwd02 \(input\)](#)
- [epp.requiredContactTypes \(input\)](#)

- [epp.serverIssuedClientCertificate01 \(file\)](#)
- [epp.serverIssuedClientCertificate02 \(file\)](#)
- [general.registryDataModel \(input\)](#)

▼ 4.4.7. Required files

- [epp.serverIssuedClientCertificate01](#)
- [epp.serverIssuedClientCertificate02](#)

▼ 4.4.8. RST-API example

```
POST /test/987654/inputs HTTP/1.1
```

```
Content-Type: application/json
```

```
Content-Length: 501
```

```
{
  "epp.clid01" : "clid-01",
  "epp.clid01DataModel" : "minimum",
  "epp.clid02" : "clid-02",

  "epp.serverIssuedClientCertificate02" : "rst_test_client_cert.pem",
  "general.registryDataModel" : "minimum"
}
```

4.5. IDN Test (RSP Evaluation)

4.5.1. Description

This test plan is identical to the Standard IDN Test, but is intended solely for use in the RSP evaluation program.

One key difference between this plan and the Standard IDN Test is that the TLD string(s) that will be used will not be real (delegated or applied-for) TLDs but test TLDs that will be determined by ICANN. Test subjects will be required to configure their systems to support these TLDs prior to the start of the test run.

Note on test environment: this is a “business as usual” test, designed to test a soon-to-be or already delegated TLD. Therefore, all input parameters provided **MUST** relate to the production registry environment.

Pass/fail criteria

As with all other [test plans](#), for this test to pass, **all** the listed test cases **MUST** pass: if **any** fail, then the test as a whole will fail.

▼ 4.5.2. Plan ID

The following Test Plan ID may be used with the RST API:

```
RSPEvaluationIDNTest
```

▼ 4.5.3. Test suites

This plan uses the following test suites:

1. [Internationalized Domain Names \(IDN\)](#)

▼ 4.5.4. Resources

The following resources may be required to prepare for this test plan:

- [epp.clientACL](#)
- [epp.clientCSR](#)
- [epp.clientCertificate](#)

▼ 4.5.5. Errors

This test plan may produce the following errors:

- [EPP_DNS_RESOLUTION_ERROR \(CRITICAL\)](#)
- [EPP_LOGIN_ERROR \(CRITICAL\)](#)
- [EPP_NO_SERVICE_PORTS_REACHABLE \(CRITICAL\)](#)
- [EPP_SCHEMA_VALIDATION_ERROR \(ERROR\)](#)
- [EPP_SERVICE_PORT_UNREACHABLE \(WARNING\)](#)
- [EPP_TLS_CONNECTION_ERROR \(ERROR\)](#)
- [EPP_XML_PARSE_ERROR \(ERROR\)](#)
- [IDN_SERVER_ACCEPTS_INVALID_LABEL \(ERROR\)](#)
- [IDN_SERVER_REJECTS_VALID_LABEL \(ERROR\)](#)

"epp.serverIssuedClientCertificate02" : "rst_test_client_cert.pem",
"general.registryDataModel" : "minimum"
}
```

4.6. SRS Gateway Test

4.6.1. Description

An SRS Gateway service is a Shared Registry System implementation that acts as a proxy between a subset of Registrars and the Registry. It uses a local cache to speed up EPP query commands, but forwards all EPP transform commands to the primary registry system. TLD registries need to deploy a proxy setup in order to operate in certain markets worldwide.

The purpose of an SRS Gateway Test is to verify that the Registry Operator's proxy setup operates in accordance with the technical and operational criteria for EPP systems described in the gTLD Applicant Guidebook (AGB). Furthermore, it **MUST** keep its own database synchronized with that of the TLD registry.

The SRS Gateway Test Change Test uses the SRS gateway test suite only.

Note on test environment: this is a “business as usual” test, designed to test a soon-to-be or already delegated TLD. Therefore, all input parameters provided **MUST** relate to the production registry environment.

Pass/fail criteria

As with all other [test plans](#), for this test to pass, **all** the listed test cases **MUST** pass: if **any** fail, then the test as a whole will fail.

▼ 4.6.2. Plan ID

The following Test Plan ID may be used with the RST API:

SRSGatewayTest

▼ 4.6.3. Test suites

This plan uses the following test suites:

1. [SRS Gateway](#)

▼ 4.6.4. Resources

The following resources may be required to prepare for this test plan:

- [epp.clientACL](#)
- [epp.clientCSR](#)
- [epp.clientCertificate](#)

▼ 4.6.5. Errors

This test plan may produce the following errors:

4.7. Main RSP Evaluation Test

4.7.1. Description

The Main RSP is responsible for the creation and maintenance of domain name registrations in a Shared Registration System (SRS). This encompasses the lifecycle of a domain name registration using domain registrars and protocols such as the Extensible Provisioning Protocol (EPP) and adherence to policies regarding the use and transparency domain name registrations through reporting, the Registration Data Access Protocol (RDAP), and other mechanisms.

Unlike the “business as usual” test plans (e.g. The Pre-Delegation Test) the TLD string(s) that will be used will not be real (delegated or applied-for) TLDs but test TLDs that will be determined by ICANN. Test subjects will be required to configure their systems to support these TLDs prior to the start of the test run.

Note on test environment: this test is designed to be used as part of the RSP evaluation program. Therefore, input parameters **MAY** be provided to relate to a test, staging or OT&E environment.

Pass/fail criteria

As with all other [test plans](#), for this test to pass, **all** the listed test cases **MUST** pass: if **any** fail, then the test as a whole will fail.

▼ 4.7.2. Plan ID

The following Test Plan ID may be used with the RST API:

MainRSPEvaluationTest

▼ 4.7.3. Test suites

This plan uses the following test suites:

1. [Registration Data Access Protocol \(RDAP\)](#)
2. [Extensible Provisioning Protocol \(EPP\)](#)
3. [Registry Data Escrow \(RDE\)](#)
4. [Minimum Rights Protection Mechanisms \(RPMs\)](#)

▼ 4.7.4. Resources

The following resources may be required to prepare for this test plan:

- [epp.clientACL](#)
- [epp.clientCSR](#)
- [epp.clientCertificate](#)
- [epp.tlsCertificateStore](#)
- [rde.encryptionKey](#)
- [tmch.testCRL](#)
- [tmch.testCert](#)
- [tmch.testDNL](#)
- [tmch.testSMDRL](#)
- [tmch.testSURL](#)

▼ 4.7.5. Errors

This test plan may produce the following errors:

- [EPP_CONTACT_CHECK_INVALID_CONTACT_ID_INCORRECT_AVAIL\(ERROR\)](#)
- [EPP_CONTACT_CHECK_REGISTERED_CONTACT_ID_INCORRECT_AVAIL\(ERROR\)](#)
- [EPP_CONTACT_CHECK_VALID_CONTACT_ID_INCORRECT_AVAIL\(ERROR\)](#)
- [EPP_CONTACT_CREATE_INFO_RESPONSE_MISSING_OR_INCORRECT_CC\(ERROR\)](#)
- [EPP_CONTACT_CREATE_INFO_RESPONSE_MISSING_OR_INCORRECT_CITY\(ERROR\)](#)

4.8. DNS RSP Evaluation Test

4.8.1. Description

DNS RSPs provide primary or secondary authoritative DNS services. Therefore, this test plan only covers the DNS area.

RSPs wishing to offer DNSSEC services in addition to authoritative DNS will also be evaluated using the DNSSEC RSP Evaluation Test.

Unlike the “business as usual” test plans (e.g. The Pre-Delegation Test) the TLD string(s) that will be used will not be real (delegated or applied-for) TLDs but test TLDs that will be determined by ICANN. Test subjects will be required to configure their

systems to support these TLDs prior to the start of the test run.

Note on test environment: this test is designed to be used as part of the RSP evaluation program. Therefore, input parameters **MAY** be provided relate to a test, staging or OT&E environment.

Pass/fail criteria

As with all other [test plans](#), for this test to pass, **all** the listed test cases **MUST** pass: if **any** fail, then the test as a whole will fail.

▼ 4.8.2. Plan ID

The following Test Plan ID may be used with the RST API:

DNSRSPEvaluationTest

▼ 4.8.3. Test suites

This plan uses the following test suites:

1. [Authoritative DNS Service](#)

▼ 4.8.4. Resources

The following resources may be required to prepare for this test plan:

- *None specified.*

▼ 4.8.5. Errors

This test plan may produce the following errors:

4.10. SRS Gateway RSP Evaluation Test

4.10.1. Description

SRS Gateway RSPs provide a proxy between a subset of Registrars and the Registry. It uses a local cache to speed up EPP query commands, but forwards all EPP transform commands to the primary registry system. TLD registries need to deploy a proxy setup in order to operate in certain markets worldwide.

The [SRS Gateway test suite](#) requires access to a primary registry system that is logically independent of the SRS Gateway system, and details of the primary registry system are required as input parameters.

RSPs wishing to offer SRS gateway services **MUST** identify such a primary registry system, which **MUST** be independent of the SRS gateway system, and **MAY** be operated by a third party.

Unlike the “business as usual” test plans (e.g. The Pre-Delegation Test) the TLD string(s) that will be used will not be real (delegated or applied-for) TLDs but test TLDs that will be determined by ICANN. Test subjects will be required to configure their systems to support these TLDs prior to the start of the test run.

Note on test environment: this test is designed to be used as part of the RSP evaluation program. Therefore, input parameters **MAY** be provided to relate to a test, staging or OT&E environment.

Pass/fail criteria

As with all other [test plans](#), for this test to pass, **all** the listed test cases **MUST** pass: if **any** fail, then the test as a whole will fail.

▼ 4.10.2. Plan ID

The following Test Plan ID may be used with the RST API:

4.11. StandardDNS (OT&E only)

4.11.1. Description

Note: this plan is only available in the OT&E environment.

This test plan allows an RSP to request testing of a single test suite, specifically the StandardDNS suite.

▼ 4.11.2. Plan ID

The following Test Plan ID may be used with the RST API:

StandardDNSOnly

▼ 4.11.3. Test suites

This plan uses the following test suites:

1. [Authoritative DNS Service](#)

▼ 4.11.4. Resources

The following resources may be required to prepare for this test plan:

- *None specified.*

▼ 4.11.5. Errors

This test plan may produce the following errors:

- [DNS_IDNA2008_INVALID_MNAME\(ERROR\)](#)
- [DNS_IDNA2008_INVALID_NS_NSDNAME\(ERROR\)](#)
- [DNS_IDNA2008_INVALID_RNAME\(ERROR\)](#)
- [DNS_IDNA2008_QUERY_FAILED\(CRITICAL\)](#)
- [DNS_INCONSISTENT_RESPONSES\(ERROR\)](#)
- [ZM_AAAA_BAD_RDATA\(ERROR\)](#)

4.15. StandardRDE (OT&E only)

4.15.1. Description

Note: this plan is only available in the OT&E environment.

This test plan allows an RSP to request testing of a single test suite, specifically the StandardRDE suite.

▼ 4.15.2. Plan ID

The following Test Plan ID may be used with the RST API:

StandardRDEOnly

▼ 4.15.3. Test suites

This plan uses the following test suites:

1. [Registry Data Escrow \(RDE\)](#).

▼ 4.15.4. Resources

The following resources may be required to prepare for this test plan:

- [rde.encryptionKey](#)

▼ 4.15.5. Errors

This test plan may produce the following errors:

- [RDE_CONTACT_HAS_INVALID_CC \(ERROR\)](#)
- [RDE_CONTACT_HAS_INVALID_EMAIL \(ERROR\)](#)
- [RDE_CONTACT_HAS_INVALID_ROID \(ERROR\)](#)
- [RDE_CONTACT_HAS_MULTIPLE_POSTALINFO_TYPES \(ERROR\)](#)
- [RDE_CONTACT_HAS_NON_UNIQUE_ID \(ERROR\)](#)
- [RDE_CONTACT_HAS_UNKNOWN_ACRR \(ERROR\)](#)
- [RDE_CONTACT_HAS_UNKNOWN_CLID \(ERROR\)](#)
- [RDE_CONTACT_HAS_UNKNOWN_CRRR \(ERROR\)](#)
- [RDE_CONTACT_HAS_UNKNOWN_RERR \(ERROR\)](#)
- [RDE_CONTACT_HAS_UNKNOWN_UPRR \(ERROR\)](#)
- [RDE_DECRYPTION_FAILED \(ERROR\)](#)
- [RDE_DOMAIN_HAS_INVALID_CLID \(ERROR\)](#)
- [RDE_DOMAIN_HAS_INVALID_CCreateDate \(ERROR\)](#)

▼ 4.15.6. Input parameters

This plan requires the following input parameters:

- [epp.greeting\(file\)](#)
- [rde.depositFile\(file\)](#)
- [rde.publicKey\(file\)](#)
- [rde.signatureFile\(file\)](#)

▼ 4.15.7. Required files

- [epp.greeting](#)
- [rde.depositFile](#)
- [rde.publicKey](#)
- [rde.signatureFile](#)

▼ 4.15.8. RST-API example

```
POST /test/987654/inputs HTTP/1.1
Content-Type: application/json
Content-Length: 206

{
  "epp.greeting" : "greeting.xml",
  "rde.depositFile" : "example_20231004_FULL_S1_R0.ryde",
  "rde.publicKey" : "rsp-rde-signing-key.asc",
  "rde.signatureFile" : "example_20231004_FULL_S1_R0.sig"
}
```

4.16. StandardSRSGateway (OT&E only)

4.16.1. Description

Note: this plan is only available in the OT&E environment.

This test plan allows an RSP to request testing of a single test suite, specifically the StandardSRSGateway suite.

▼ 4.16.2. Plan ID

The following Test Plan ID may be used with the RST API:

StandardSRSGatewayOnly

▼ 4.16.3. Test suites

This plan uses the following test suites:

1. [SRS Gateway](#)

▼ 4.16.4. Resources

The following resources may be required to prepare for this test plan:

- [epp.clientACL](#)
- [epp.clientCSR](#)
- [epp.clientCertificate](#)

▼ 4.16.5. Errors

This test plan may produce the following errors:

- [EPP_DNS_RESOLUTION_ERROR \(CRITICAL\)](#)
- [EPP_LOGIN_ERROR \(CRITICAL\)](#)
- [EPP_NO_SERVICE_PORTS_REACHABLE \(CRITICAL\)](#)
- [EPP_SCHEMA_VALIDATION_ERROR \(ERROR\)](#)

4.17. MinimumRPMs (OT&E only)

4.17.1. Description

Note: this plan is only available in the OT&E environment.

This test plan allows an RSP to request testing of a single test suite, specifically the MinimumRPMs suite.

▼ 4.17.2. Plan ID

The following Test Plan ID may be used with the RST API:

MinimumRPMsOnly

▼ 4.17.3. Test suites

This plan uses the following test suites:

1. [Minimum Rights Protection Mechanisms \(RPMs\)](#)

▼ 4.17.4. Resources

The following resources may be required to prepare for this test plan:

- [tmch.testCRL](#)
- [tmch.testCert](#)
- [tmch.testDNL](#)
- [tmch.testSMDRL](#)
- [tmch.testSURL](#)

▼ 4.17.5. Errors

This test plan may produce the following errors:

- [EPP_DNS_RESOLUTION_ERROR \(CRITICAL\)](#)
- [EPP_LOGIN_ERROR \(CRITICAL\)](#)
- [EPP_NO_SERVICE_PORTS_REACHABLE \(CRITICAL\)](#)
- [EPP_SCHEMA_VALIDATION_ERROR \(ERROR\)](#)
- [EPP_SERVICE_PORT_UNREACHABLE \(WARNING\)](#)
- [EPP_TLS_CONNECTION_ERROR \(ERROR\)](#)
- [EPP_XML_PARSE_ERROR \(ERROR\)](#)
- [RPMS_MISSING CLAIMS KEY \(ERROR\)](#)
- [RPMS_SUNRISE_CREATE_INFO_OBJECT_DOES_NOT_EXIST \(ERROR\)](#)
- [RPMS_SUNRISE_CREATE_INFO_OBJECT_IS_HAS_MISSING_OR_INVALID_PROPERTIES \(ERROR\)](#)
- [RPMS_SUNRISE_CREATE_UNEXPECTED_FAILURE USING VALID SMD \(ERROR\)](#)
- [RPMS_SUNRISE_CREATE_UNEXPECTED_SUCCESS USING EXPIRED SMD \(ERROR\)](#)

- [RPMS_SUNRISE_CREATE_UNEXPECTED_SUCCESS_USING_INCORRECT_SMD\(ERROR\)](#)
- [RPMS_SUNRISE_CREATE_UNEXPECTED_SUCCESS_USING_REVOKED_SMD\(ERROR\)](#)
- [RPMS_SUNRISE_CREATE_UNEXPECTED_SUCCESS_USING_SMD_WITH_REVOKED_SIGNATURE\(ERROR\)](#)

```

5. Test Suites

5.1. Authoritative DNS Service

5.1.1. Description

The DNS test suite validates the authoritative DNS services for the TLD or RSP.

The DNS test suite is derived from the test plans in version **v2023.1.4** of [Zonemaster](#). Test case IDs from this document can be mapped to the Zonemaster test IDs by removing the dns- prefix.

Since Zonemaster is designed to perform testing of domain names anywhere in the DNS hierarchy, not all Zonemaster tests are applicable for TLDs and may not be listed in the test suites in this document.

Testing of Anycast networks using multiple vantage points

In order to test anycast networks without requiring RSPs to provide the unicast addresses of their nodes, tests carried out over the network will be performed from multiple vantage points. All vantage points **MUST** receive the same response in order for the tests to pass.

Pass/fail criteria

As with all other [test suites](#), for this test suite to pass **all** the listed test cases **MUST** pass: if **any** fail, then the suite as a whole will fail.

Unless stated otherwise, the pass/fail criteria for the test cases in this suite are the same as those defined in the Zonemaster documentation: that is, if Zonemaster reports that a test case has an ERROR or CRITICAL result, then the corresponding test case in this suite will fail. INFO, NOTICE and WARNING results will not result in a failed test case. Error codes in this suite are prefixed with ZM_ which map onto the message tags used by Zonemaster.

▼ 5.1.2. Test cases

This suite uses the following test cases:

1. [dns-address01 - Name server address must be globally routable](#)
2. [dns-address02 - Reverse DNS entry exists for name server IP address](#)
3. [dns-address03 - Reverse DNS entry matches name server name](#)
4. [dns-connectivity01 - UDP connectivity to name servers](#)
5. [dns-connectivity02 - TCP connectivity to name servers](#)
6. [dns-connectivity03 - AS Diversity](#)
7. [dns-consistency02 - SOA RNAME consistency](#)
8. [dns-consistency03 - SOA timers consistency](#)
9. [dns-consistency04 - Name server NS consistency](#)
10. [dns-consistency05 - Consistency between glue and authoritative data](#)
11. [dns-consistency06 - SOA MNAME consistency](#)
12. [dns-delegation01 - Minimum number of name servers](#)
13. [dns-delegation02 - Name servers must have distinct IP addresses](#)
14. [dns-delegation03 - No truncation of referrals](#)
15. [dns-delegation04 - Name server is authoritative](#)
16. [dns-delegation05 - Name server must not point at CNAME alias](#)
17. [dns-delegation07 - Parent glue name records present in child](#)
18. [dns-nameserver01 - A name server should not be a recursor](#)
19. [dns-nameserver02 - Test of EDNS0 support](#)
20. [dns-nameserver04 - Same source address](#)
21. [dns-nameserver05 - Behaviour against AAAA query](#)
22. [dns-nameserver06 - NS can be resolved](#)
23. [dns-nameserver08 - Testing QNAME case insensitivity](#)

24. [dns-nameserver09 - Testing QNAME case sensitivity](#)
25. [dns-nameserver10 - Test for undefined EDNS version](#)
26. [dns-nameserver11 - Test for unknown EDNS OPTION-CODE](#)
27. [dns-nameserver12 - Test for unknown EDNS flags](#)
28. [dns-nameserver13 - Test for truncated response on EDNS query](#)
29. [dns-syntax05 - Misuse of '@' character in the SOA RNAME field](#)
30. [dns-syntax06 - No illegal characters in the SOA RNAME field](#)
31. [dns-syntax07 - No illegal characters in the SOA MNAME field](#)
32. [dns-zone07 - SOA master is not an alias](#)
33. [dns-zone10 - No multiple SOA records](#)
34. [dns-zz-idna2008-compliance - IDNA2008 compliance check](#)

▼ 5.1.3. Test plans

This suite is used by the following test plans:

1. [Pre-Delegation Test](#)
2. [RSP Change Test](#)
3. [DNS RSP Change Test](#)
4. [DNS RSP Evaluation Test](#)
5. [StandardDNS](#)

▼ 5.1.4. Resources

The following resources may be required to prepare for this test plan:

- *None specified.*

▼ 5.1.5. Errors

This test suite may produce the following errors:

- [DNS_IDNA2008_INVALID_MNAME\(ERROR\)](#)
- [DNS_IDNA2008_INVALID_NS_NSDNAME\(ERROR\)](#)
- [DNS_IDNA2008_INVALID_RNAME\(ERROR\)](#)
- [DNS_IDNA2008_QUERY_FAILED\(CRITICAL\)](#)
- [DNS_INCONSISTENT_RESPONSES\(ERROR\)](#)

▼ 5.1.6. Input parameters

The test cases used by this suite require the following input parameters:

1. [dns.nameservers \(input\)](#)

5.2. DNS Security Extensions (DNSSEC)

5.2.1. Description

The DNSSEC test suite validates the DNSSEC signing service for the TLD or RSP.

The DNSSEC test suite is derived from the test plans in version **v2023.1.4** of [Zonemaster](#). Test case IDs from this document can be mapped to the Zonemaster test IDs by removing the hyphen-minus.

Since Zonemaster is designed to perform testing of domain names anywhere in the DNS hierarchy, not all Zonemaster tests are applicable for TLDs and may not be listed in the test suites in this document.

Pass/fail criteria

As with all other [test suites](#), for this test suite to pass **all** the listed test cases **MUST** pass: if **any** fail, then the suite as a whole will fail.

Unless stated otherwise, the pass/fail criteria for the test cases in this suite are the same as those defined in the Zonemaster documentation: that is, if Zonemaster reports that a test case has an **ERROR** or **CRITICAL** result, then the corresponding test case in this suite will fail. **INFO**, **NOTICE** and **WARNING** results will not result in a failed test case. Error codes in this suite are prefixed with **ZM_** which map onto the message tags used by Zonemaster.

▼ 5.2.2. Test cases

This suite uses the following test cases:

1. [dnssec-01 - Legal values for the DS hash digest algorithm](#)
2. [dnssec-02 - DS must match a valid DNSKEY in the child zone](#)
3. [dnssec-03 - Check for too many NSEC3 iterations](#)
4. [dnssec-04 - Check for too short or too long RRSIG lifetimes](#)
5. [dnssec-05 - Check for invalid DNSKEY algorithms](#)
6. [dnssec-06 - Verify DNSSEC additional processing](#)
7. [dnssec-08 - Valid RRSIG for DNSKEY](#)
8. [dnssec-09 - RRSIG\(SOA\) must be valid and created by a valid DNSKEY](#)
9. [dnssec-10 - Zone contains NSEC or NSEC3 records](#)
10. [dnssec-13 - All DNSKEY algorithms used to sign the zone](#)
11. [dnssec-14 - Check for valid RSA DNSKEY key size](#)
12. [dnssec-91 - Permitted signing algorithms](#)
13. [dnssec-92 - Permitted DS record hash algorithm\(s\)](#)
14. [dnssec-93 - NSEC3 iterations check](#)

▼ 5.2.3. Test plans

This suite is used by the following test plans:

1. [Pre-Delegation Test](#)
2. [RSP Change Test](#)
3. [DNS RSP Change Test](#)
4. [DNSSEC RSP Evaluation Test](#)
5. [StandardDNSSEC](#)

▼ 5.2.4. Resources

The following resources may be required to prepare for this test plan:

- *None specified.*

▼ 5.2.5. Errors

This test suite may produce the following errors:

- [DNSSEC_DNS_QUERY_ERROR\(ERROR\)](#)

▼ 5.2.6. Input parameters

The test cases used by this suite require the following input parameters:

1. [dns.nameservers \(input\)](#)
2. [dnssec.dsRecords \(input\)](#)

5.3. Registration Data Access Protocol (RDAP)

5.3.1. Description

The RDAP test suite validates the RDAP service of the TLD or RSP.

The RDAP test suite is derived from the test specification of the [RDAP Conformance Tool](#). As with the DNS and DNSSEC tests, the test IDs can be mapped to the test IDs in this document by removing the rdap-NN- prefix.

Pass/fail criteria

As with all other [test suites](#), for this test suite to pass **all** the listed test cases **MUST** pass: if **any** fail, then the suite as a whole will fail.

▼ 5.3.2. Test cases

This suite uses the following test cases:

1. [rdap-01-ipv4Validation - IPv4 address validation](#)
2. [rdap-02-ipv6Validation - IPv6 address validation](#)
3. [rdap-03-domainNameValidation - Domain Name validation](#)
4. [rdap-04-webUriValidation - Web URI validation](#)
5. [rdap-05-domainCaseFoldingValidation - Domain label case folding validation](#)
6. [rdap-06-stdRdapConformanceValidation - RDAP Conformance validation](#)
7. [rdap-07-stdRdapLinksValidation - Links validation](#)
8. [rdap-08-stdRdapNoticesRemarksValidation - Notices and Remarks Validation](#)
9. [rdap-09-stdRdapLanguageIdentifierValidation - Language Identifier Validation](#)

▼ 5.3.6. Input parameters

The test cases used by this suite require the following input parameters:

1. [rdap.baseURLs \(input\)](#)
2. [rdap.testDomains \(input\)](#)
3. [rdap.testEntities \(input\)](#)
4. [rdap.testNameservers \(input\)](#)

5.4. Extensible Provisioning Protocol (EPP)

5.4.1. Description

The EPP test suite validates the EPP service of the TLD or RSP. It verifies that the EPP server properly implements the query and transform commands specified for domain names (and optionally host and contact objects) and the mandatory extensions.

Pass/fail criteria

As with all other [test suites](#), for this test suite to pass **all** the listed test cases **MUST** pass: if **any** fail, then the suite as a whole will fail.

▼ 5.4.2. Test cases

This suite uses the following test cases:

1. [epp-01 - Service connectivity test](#)
2. [epp-02 - Protocol conformance test](#)
3. [epp-03 - Authentication test](#)
4. [epp-04 - Domain <check> command test](#)
5. [epp-05 - Host <check> command test \(if applicable\)](#)
6. [epp-06 - Contact <check> command test \(if applicable for the registry type\)](#)
7. [epp-07 - Contact <create> command test \(if applicable for the registry type\)](#)
8. [epp-08 - Contact object access control \(if applicable\)](#)
9. [epp-09 - Contact <update> command test \(if applicable for the registry type\)](#)
10. [epp-10 - Contact <delete> command test \(if applicable for the registry type\)](#)
11. [epp-11 - Host <create> command test \(if applicable\)](#)
12. [epp-12 - Host object access control \(if applicable\)](#)
13. [epp-13 - Host <update> command test \(if applicable\)](#)
14. [epp-14 - Domain <create> command test](#)
15. [epp-15 - Registry object integrity test](#)
16. [epp-16 - Domain <update> command test](#)
17. [epp-17 - Service Port consistency test](#)
18. [epp-18 - Domain <renew> command test](#)
19. [epp-19 - Domain <transfer> command test](#)
20. [epp-20 - Domain <transfer> rejection test](#)
21. [epp-21 - Domain <delete> command test](#)
22. [epp-22 - Domain restore test](#)
23. [epp-23 - Host rename test \(if applicable\)](#)
24. [epp-24 - Host <delete> command test \(if applicable\)](#)

▼ 5.4.3. Test plans

This suite is used by the following test plans:

1. [Pre-Delegation Test](#)
2. [RSP Change Test](#)
3. [Main RSP Evaluation Test](#)
4. [StandardEPP](#)

▼ 5.4.4. Resources

The following resources may be required to prepare for this test plan:

- [epp.clientACL](#)
- [epp.clientCSR](#)
- [epp.clientCertificate](#)
- [epp.tlsCertificateStore](#)

▼ 5.4.5. Errors

This test suite may produce the following errors:

- [EPP_CONTACT_CHECK_INVALID_CONTACT_ID_INCORRECT_AVAIL\(ERROR\)](#)
- [EPP_CONTACT_CHECK_REGISTERED_CONTACT_ID_INCORRECT_AVAIL\(ERROR\)](#)
- [EPP_CONTACT_CHECK_VALID_CONTACT_ID_INCORRECT_AVAIL\(ERROR\)](#)

5.5. Registry Data Escrow (RDE)

5.5.1. Description

The RDE test suite validates Registry Data Escrow deposits generated for the TLD or RSP. These deposits **MUST** comply with the specifications in the Registry Agreement and with RFC 8909 and RFC 9022.

Pass/fail criteria

As with all other [test suites](#), for this test suite to pass **all** the listed test cases **MUST** pass: if **any** fail, then the suite as a whole will fail.

▼ 5.5.2. Test cases

This suite uses the following test cases:

1. [rde-01 - validate deposit filename format](#)
2. [rde-02 - validate signature over deposit file](#)
3. [rde-03 - decrypt deposit file\(s\)](#)
4. [rde-04 - validate XML/CSV](#)
5. [rde-05 - validate object types](#)
6. [rde-06 - validate object counts](#)
7. [rde-07 - validate domain objects](#)
8. [rde-08 - validate host objects \(if applicable\)](#)
9. [rde-09 - validate contact objects \(if applicable\)](#)
10. [rde-10 - validate registrar objects](#)
11. [rde-11 - validate IDN table objects \(if applicable\)](#)
12. [rde-12 - validate NNDN objects](#)
13. [rde-13 - validate EPP parameters object](#)
14. [rde-14 - validate policy object \(if applicable\)](#)

▼ 5.5.3. Test plans

This suite is used by the following test plans:

1. [Pre-Delegation Test](#)
2. [RSP Change Test](#)
3. [Main RSP Evaluation Test](#)
4. [StandardRDE](#)

▼ 5.5.4. Resources

The following resources may be required to prepare for this test plan:

- [rde.encryptionKey](#)

▼ 5.5.5. Errors

This test suite may produce the following errors:

- [RDE_CONTACT_HAS_INVALID_CC\(ERROR\)](#)
- [RDE_CONTACT_HAS_INVALID_EMAIL\(ERROR\)](#)

▼ 5.5.6. Input parameters

The test cases used by this suite require the following input parameters:

1. [epp.greeting\(file\)](#)
2. [rde.depositFile\(file\)](#)
3. [rde.publicKey\(file\)](#)
4. [rde.signatureFile\(file\)](#)

5.6. Internationalized Domain Names (IDN)

5.6.1. Description

The RDE test suite validates the IDN table(s) for a TLD or RSP, including compliance with specifications for variant labels at the top- or second- level, and conformance with the IDN Guidelines.

Pass/fail criteria

As with all other [test suites](#), for this test suite to pass **all** the listed test cases **MUST** pass: if **any** fail, then the suite as a whole will fail.

▼ 5.6.2. Test cases

This suite uses the following test cases:

1. [idn-01 - Label validation test](#)
2. [idn-02 - Level 1 variant handling test](#)
3. [idn-03 - Level 2 variant handling test](#)
4. [idn-04 - Level 3 variant handling test](#)

▼ 5.6.3. Test plans

This suite is used by the following test plans:

1. [Pre-Delegation Test](#)
2. [RSP Change Test](#)
3. [Standard IDN Test](#)
4. [IDN Test \(RSP Evaluation\)](#)

▼ 5.6.4. Resources

The following resources may be required to prepare for this test plan:

- [epp.clientACL](#)
- [epp.clientCSR](#)
- [epp.clientCertificate](#)

▼ 5.6.5. Errors

This test suite may produce the following errors:

- [EPP_DNS_RESOLUTION_ERROR\(CRITICAL\)](#)
- [EPP_LOGIN_ERROR\(CRITICAL\)](#)
- [EPP_NO_SERVICE_PORTS_REACHABLE\(CRITICAL\)](#)

- [EPP_SCHEMA_VALIDATION_ERROR \(ERROR\)](#)
- [EPP_SERVICE_PORT_UNREACHABLE \(WARNING\)](#)
- [EPP_TLS_CONNECTION_ERROR \(ERROR\)](#)
- [EPP_XML_PARSE_ERROR \(ERROR\)](#)
- [IDN_SERVER_ACCEPTS_INVALID_LABEL \(ERROR\)](#)
- [IDN_SERVER_REJECTS_VALID_LABEL \(ERROR\)](#)
- [IDN_VARIANT_LABEL_NOT_BLOCKED \(ERROR\)](#)
- [IDN_VARIANT_SERVER_ACCEPTS_VARIANT_CREATE_FROM_INCORRECT_REGISTRAR \(ERROR\)](#)
- [IDN_VARIANT_SERVER_ACCEPTS_VARIANT_CREATE_WITH_INCORRECT_REGISTRANT \(ERROR\)](#)
- [IDN_VARIANT_SERVER_REJECTS_VARIANT_CREATE_FROM_SAME_REGISTRAR \(ERROR\)](#)
- [IDN_VARIANT_SERVER_REJECTS_VARIANT_CREATE_WITH_SAME_REGISTRANT \(ERROR\)](#)

▼ 5.6.6. Input parameters

The test cases used by this suite require the following input parameters:

1. [epp.clid01 \(input\)](#)
2. [epp.clid01DataModel \(input\)](#)
3. [epp.clid02 \(input\)](#)
4. [epp.clid02DataModel \(input\)](#)
5. [epp.hostModel \(input\)](#)
6. [epp.hostName \(input\)](#)
7. [epp.pwd01 \(input\)](#)
8. [epp.pwd02 \(input\)](#)
9. [epp.requiredContactTypes \(input\)](#)
10. [epp.serverIssuedClientCertificate01 \(file\)](#)
11. [epp.serverIssuedClientCertificate02 \(file\)](#)
12. [general.registryDataModel \(input\)](#)

5.7. SRS Gateway

5.7.1. Description

The SRS Gateway test suite validates the conformance of the Gateway registry infrastructure of a TLD or RSP, and the synchronisation between primary and gateway systems.

Pass/fail criteria

As with all other [test suites](#), for this test suite to pass **all** the listed test cases **MUST** pass: if **any** fail, then the suite as a whole will fail.

▼ 5.7.2. Test cases

This suite uses the following test cases:

1. [srsgw-01 - IPv4 and IPv6 connectivity](#)
2. [srsgw-02 - Host <create> synchronization \(if applicable\)](#)
3. [srsgw-03 - Contact <create> synchronization \(if applicable\)](#)
4. [srsgw-04 - Domain <create> synchronization](#)
5. [srsgw-05 - Domain <renew> synchronisation](#)
6. [srsgw-06 - Domain <transfer> synchronisation](#)
7. [srsgw-07 - Domain <transfer> approval synchronisation](#)
8. [srsgw-08 - Domain <delete> synchronisation](#)
9. [srsgw-09 - Host <update> synchronization \(if applicable\)](#)
10. [srsgw-10 - Host <delete> synchronization \(if applicable\)](#)
11. [srsgw-11 - Contact <update> synchronization \(if applicable\)](#)
12. [srsgw-12 - Contact <delete> synchronization \(if applicable\)](#)

13. [srsgw-13 - Domain RDAP synchronization](#)
14. [srsgw-14 - Nameserver RDAP synchronization](#)
15. [srsgw-15 - Registrar RDAP synchronization](#)

▼ 5.7.3. Test plans

This suite is used by the following test plans:

1. [SRS Gateway Test](#)
2. [SRS Gateway RSP Evaluation Test](#)
3. [StandardSRSGateway](#)

▼ 5.7.4. Resources

The following resources may be required to prepare for this test plan:

- [epp.clientACL](#)
- [epp.clientCSR](#)
- [epp.clientCertificate](#)

▼ 5.7.5. Errors

This test suite may produce the following errors:

- [EPP_DNS_RESOLUTION_ERROR \(CRITICAL\)](#)
- [EPP_LOGIN_ERROR \(CRITICAL\)](#)
- [EPP_NO_SERVICE_PORTS_REACHABLE \(CRITICAL\)](#)
- [EPP_SCHEMA_VALIDATION_ERROR \(ERROR\)](#)
- [EPP_SERVICE_PORT_UNREACHABLE \(WARNING\)](#)
- [EPP_TLS_CONNECTION_ERROR \(ERROR\)](#)
- [EPP_XML_PARSE_ERROR \(ERROR\)](#)
- [SRSGW_CONTACT_CREATE_FAILED \(CRITICAL\)](#)
- [SRSGW_CONTACT_CREATE_OBJECT_HAS_MISSING_OR_INVALID_PROPERTIES \(ERROR\)](#)
- [SRSGW_CONTACT_CREATE_OBJECT_NOT_FOUND_WITHIN_DEADLINE \(ERROR\)](#)
- [SRSGW_DOMAIN_CREATE_FAILED \(CRITICAL\)](#)
- [SRSGW_DOMAIN_CREATE_OBJECT_HAS_MISSING_OR_INVALID_PROPERTIES \(ERROR\)](#)
- [SRSGW_DOMAIN_CREATE_OBJECT_NOT_FOUND_WITHIN_DEADLINE \(ERROR\)](#)
- [SRSGW_DOMAIN_DELETE_DOMAIN_NOT_PENDINGDELETE \(ERROR\)](#)
- [SRSGW_DOMAIN_DELETE_FAILED \(CRITICAL\)](#)
- [SRSGW_DOMAIN_DELETE_RGP_STATUS_NOT_PENDINGDELETERESTORABLE \(ERROR\)](#)
- [SRSGW_DOMAIN_RENEW_FAILED \(CRITICAL\)](#)
- [SRSGW_DOMAIN_RENEW_OBJECT_NOT_UPDATED_WITHIN_DEADLINE \(ERROR\)](#)

 19. [srsgw.rdapBaseURLs \(input\)](#)
 20. [srsgw.serverIssuedClientCertificate01 \(file\)](#)
 21. [srsgw.serverIssuedClientCertificate02 \(file\)](#)
-

5.8. DNSSEC Operations

5.8.1. Description

This test suite verifies the ability of an RSP to carry out standard DNSSEC operational procedures while maintaining a chain of trust to the parent zone.

Pass/fail criteria

As with all other [test suites](#), for this test suite to pass **all** the listed test cases **MUST** pass: if **any** fail, then the suite as a whole will fail.

▼ 5.8.2. Test cases

This suite uses the following test cases:

1. [dnssecOps01-ZSKRollover - ZSK rollover](#)
2. [dnssecOps02-KSKRollover - KSK rollover](#)
3. [dnssecOps03-AlgorithmRollover - algorithm rollover](#)

▼ 5.8.3. Test plans

This suite is used by the following test plans:

1. [DNSSEC RSP Evaluation Test](#)

▼ 5.8.4. Resources

The following resources may be required to prepare for this test plan:

- [dnssecOps.xfrACL](#)

▼ 5.8.5. Errors

This test suite may produce the following errors:

- [DNSSEC_OPS_ALGORITHM_ROLLOVER_CHAIN_OF_TRUST_BROKEN\(ERROR\)](#)
- [DNSSEC_OPS_ALGORITHM_ROLLOVER_NOT_COMPLETED\(ERROR\)](#)
- [DNSSEC_OPS_DNS_QUERY_FAILED_TOO_MANY_TIMES\(ERROR\)](#)
- [DNSSEC_OPS_INVALID_ALGORITHM\(ERROR\)](#)
- [DNSSEC_OPS_KSK_ROLLOVER_CHAIN_OF_TRUST_BROKEN\(ERROR\)](#)
- [DNSSEC_OPS_KSK_ROLLOVER_NOT_COMPLETED\(ERROR\)](#)

- [DNSSEC_OPS_ZSK_ROLLOVER_CHAIN_OF_TRUST_BROKEN\(ERROR\)](#)
- [DNSSEC_OPS_ZSK_ROLLOVER_NOT_COMPLETED\(ERROR\)](#)

▼ 5.8.6. Input parameters

The test cases used by this suite require the following input parameters:

1. [dnssecOps.algorithmRolloverZone \(input\)](#)
2. [dnssecOps.csk \(input\)](#)
3. [dnssecOps.kskRolloverZone \(input\)](#)
4. [dnssecOps.nameservers \(input\)](#)
5. [dnssecOps.primaryServers \(input\)](#)
6. [dnssecOps.tsigKey \(input\)](#)
7. [dnssecOps.zskRolloverZone \(input\)](#)

5.9. Minimum Rights Protection Mechanisms (RPMs)

5.9.1. Description

This test suite verifies an RSP's support for the minimum Rights Protection Mechanisms (RPMs), and the Launch Extension (RFC 8334).

Pass/fail criteria

As with all other [test suites](#), for this test suite to pass **all** the listed test cases **MUST** pass: if **any** fail, then the suite as a whole will fail.

▼ 5.9.2. Test cases

This suite uses the following test cases:

1. [minimumRPMs-01 - Claims <check> command test](#)
2. [minimumRPMs-02 - Sunrise domain/launch application <create> command test](#)
3. [minimumRPMs-03 - Trademark claims domain <create> command test](#)

▼ 5.9.3. Test plans

This suite is used by the following test plans:

1. [Main RSP Evaluation Test](#)
2. [MinimumRPMs](#)

▼ 5.9.4. Resources

The following resources may be required to prepare for this test plan:

- [tmch.testCRL](#)
- [tmch.testCert](#)
- [tmch.testDNL](#)
- [tmch.testSMDRL](#)
- [tmch.testSURL](#)

▼ 5.9.5. Errors

This test suite may produce the following errors:

- [EPP_DNS_RESOLUTION_ERROR \(CRITICAL\)](#)
- [EPP_LOGIN_ERROR \(CRITICAL\)](#)
- [EPP_NO_SERVICE_PORTS_REACHABLE \(CRITICAL\)](#)
- [EPP_SCHEMA_VALIDATION_ERROR \(ERROR\)](#)
- [EPP_SERVICE_PORT_UNREACHABLE \(WARNING\)](#)
- [EPP_TLS_CONNECTION_ERROR \(ERROR\)](#)

 15. [minimumRPMS.sunriseTLD \(input\)](#)
-

5.10. Standard Integration Test

5.10.1. Description

This test suite verifies that the critical registry services of the TLD are properly integrated and functioning within the requirements of the Service Level Agreement.

Pass/fail criteria

As with all other [test suites](#), for this test suite to pass **all** the listed test cases **MUST** pass: if **any** fail, then the suite as a whole will fail.

▼ 5.10.2. Test cases

This suite uses the following test cases:

1. [integration-01 - EPP -> RDAP Integration Test](#)
2. [integration-02 - EPP -> DNS Integration Test](#)
3. [integration-03 - EPP -> RDE Integration Test](#)

▼ 5.10.3. Test plans

This suite is used by the following test plans:

1. [Pre-Delegation Test](#)
2. [RSP Change Test](#)

▼ 5.10.4. Resources

The following resources may be required to prepare for this test plan:

- [integration.rdeSFTPACL](#)
- [integration.rdeSFTPPublicKey](#)

▼ 5.10.5. Errors

This test suite may produce the following errors:

- [EPP_DNS_RESOLUTION_ERROR \(CRITICAL\)](#)
- [EPP_GENERIC_COMMAND_ERROR \(ERROR\)](#)
- [EPP_LOGIN_ERROR \(CRITICAL\)](#)
- [EPP_NO_SERVICE_PORTS_REACHABLE \(CRITICAL\)](#)

 12. [integration.rriACL \(input\)](#)
 13. [rdap.baseURLs \(input\)](#)
-

6. Resources

6.1. dnssecOps.xfrACL

6.1.1. Description

A list of IPv4 and IPv6 address(es) from which zone file transfers to primary DNS servers will be made. The list is a plain text file with each IP address on a separate line.

6.1.2. URL

- <https://rst.icann.org/v2/resources/dnssecOps.xfrACL.txt>
-

6.2. epp.clientACL

6.2.1. Description

A list of IPv4 and IPv6 address(es) from which client connections to the operator's EPP server will be made. The list is a plain text file with each IP address on a separate line.

6.2.2. URL

- <https://rst.icann.org/v2/resources/epp.clientACL.txt>
-

6.3. epp.clientCSR

6.3.1. Description

For servers that operate a private CA, this CSR may be used to issue a client certificate. This certificate must then be provided in the `epp.clientCertificate` input parameter.

6.3.2. URL

-
-

6.4. epp.clientCertificate

6.4.1. Description

RFC 5734 requires servers to perform authentication of clients by means of a client certificate. Operators **MUST** configure their systems to permit the test client to connect using the certificate found at this URL.

6.4.2. URL

- <https://rst.icann.org/v2/resources/epp.clientCertificate.pem>
-

6.5. epp.tlsCertificateStore

6.5.1. Description

A PEM-formatted file containing the CA certificates trusted by Mozilla. For more information, see <https://curl.se/docs/caextract.html>.

EPP servers **MUST** use a certificate that has a chain of trust to one of the CAs present in this file.

6.5.2. URL

- <https://rst.icann.org/v2/resources/epp.tlsCertificateStore.pem>
-

6.6. integration.rdeSFTPACL

6.6.1. Description

A list of IPv4 and IPv6 address(es) from which client connections to the operator's SFTP server will be made. The list is a plain text file with each IP address on a separate line.

6.6.2. URL

- <https://rst.icann.org/v2/resources/integration.rdeSFTPACL.txt>
-

6.7. integration.rdeSFTPPublicKey

6.7.1. Description

The SSH public key that will be used to authenticate connections to the operator's SFTP server.

6.7.2. URL

- <https://rst.icann.org/v2/resources/integration.rdeSFTPPublicKey.pem>
-

6.8. rde.encryptionKey

6.8.1. Description

RDE deposit files **MUST** be encrypted using OpenPGP (RFC 4880). The PGP key that **MUST** be used to encrypt the escrow deposit file may be found at this URL.

6.8.2. URL

- <https://rst.icann.org/v2/resources/rde.encryptionKey.asc>
-

6.9. tmch.testCRL

6.9.1. Description

A Certificate Revocation List (CRL) that identifies revoked TMCH certificates.

6.9.2. URL

- http://crl.icann.org/tmch_pilot.crl
-

6.10. tmch.testCert

6.10.1. Description

The x509 certificate that is the trust anchor for the test TMCH system. This certificate can be used to validate the digital signatures on SMD files.

6.10.2. URL

- https://ca.icann.org/tmch_pilot.crt
-

6.11. tmch.testDNL

6.11.1. Description

A file containing the list of labels subject to Trademark Claims in the TMCH test environment.

6.11.2. URL

- <https://example.com/tba>
-

6.12. tmch.testSMDRL

6.12.1. Description

A CSV file containing a list of revoked SMDs.

6.12.2. URL

- <https://newgtlds.icann.org/en/about/trademark-clearinghouse/smd-test-revocation-22nov22-en.csv>
-

6.13. tmch.testSURL

6.13.1. Description

A file containing the list of labels for which SMDs have been produced in the TMCH test environment.

6.13.2. URL

- <https://example.com/tba>
-

7. Test Cases

7.1. dns-address01 - Name server address must be globally routable

7.1.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.1.2. Description

Note: the severity levels of one or more error codes for this test case have been changed from the default.

This test case comes from version v2023.1.4 of Zonemaster. For more information, please refer to [the documentation for this test case](#).

Objective

In order for the domain and its resources to be accessible, authoritative name servers must have addresses in the routable public addressing space.

IANA is responsible for global coordination of the IP addressing system. Aside its address allocation activities, it maintains reserved address ranges for special uses. These ranges can be categorized into three types : [Special purpose IPv4 addresses](#), [Special purpose IPv6 addresses](#) and [Multicast reserved addresses](#).

▼ 7.1.3. Errors

This test case may produce the following errors:

- [DNS_INCONSISTENT_RESPONSES \(ERROR\)](#)
- [ZM_NAMESERVER_IP_PRIVATE_NETWORK \(CRITICAL\)](#)

▼ 7.1.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.1.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.1.6. Test suites

This test case is used in the following test suite(s):

- [Authoritative DNS Service](#)
-

7.2. dns-address02 - Reverse DNS entry exists for name server IP address

7.2.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.2.2. Description

This test case comes from version v2023.1.4 of Zonemaster. For more information, please refer to [the documentation for this test case](#).

Objective

Some anti-spam techniques use reverse DNS lookup to allow incoming traffic. In order to prevent name servers to be blocked or blacklisted, DNS administrators should publish PTR records associated to name server addresses.

[technical reference to be found]

▼ 7.2.3. Errors

This test case may produce the following errors:

- [DNS_INCONSISTENT_RESPONSES \(ERROR\)](#)
- [ZM_NAMESERVER_IP_WITHOUT_REVERSE \(WARNING\)](#)
- [ZM_NO_RESPONSE_PTR_QUERY \(WARNING\)](#)

▼ 7.2.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.2.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.2.6. Test suites

This test case is used in the following test suite(s):

- [Authoritative DNS Service](#)
-

7.3. dns-address03 - Reverse DNS entry matches name server name

7.3.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.3.2. Description

This test case comes from version v2023.1.4 of Zonemaster. For more information, please refer to [the documentation for this test case](#).

Objective

Some anti-spam techniques use reverse DNS lookup to allow incoming traffic. In order to prevent name servers to be blocked or blacklisted, DNS administrators should publish PTR records associated with the name server addresses.

Moreover, as mentioned in paragraph 2.1 of [RFC 1912](#) when a PTR record exists, it must match the host name.

▼ 7.3.3. Errors

This test case may produce the following errors:

- [DNS_INCONSISTENT_RESPONSES \(ERROR\)](#)
- [ZM_NAMESERVER_IP_WITHOUT_REVERSE \(WARNING\)](#)
- [ZM_NO_RESPONSE_PTR_QUERY \(WARNING\)](#)

▼ 7.3.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.3.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.3.6. Test suites

This test case is used in the following test suite(s):

- [Authoritative DNS Service](#)

7.4. dns-connectivity01 - UDP connectivity to name servers

7.4.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.4.2. Description

Note: the severity levels of one or more error codes for this test case have been changed from the default.

This test case comes from version v2023.1.4 of Zonemaster. For more information, please refer to [the documentation for this test case](#).

Objective

UDP is the fundamental protocol to reach a general purpose name server hosting a zone, “DNS servers MUST be able to service UDP [...]” ([RFC 1123](#), section 6.1.3.2, page 75), also restated in [RFC 7766](#), section 5.

This Test Case will verify if the name servers of *Child Zone* are reachable over UDP. The name servers tested are both those in the delegation of *Child Zone* and those in the NS records in the *Child Zone* itself.

Most Zonemaster Test Cases will query the name servers in the delegation or the name servers appointed by the NS records in the zone for the NS or SOA record, or both. It is crucial that problems are reported, but instead of letting several Test Cases report the same problems found, most Test Cases assume that this test case is run. Only this Test Case will report problems found in the following areas over UDP:

- Name Server not responding to a query without EDNS.
- Name Server not including SOA record of *Child Zone* in the answer section in the response on a SOA query for *Child Zone*.
- Name Server not including NS record of *Child Zone* in the answer section in the response on an NS query for *Child Zone*.
- Name Server not setting the AA flag in a response with SOA or NS in answer section.
- Name Server responding with unexpected [RCODE Name](#) (any except “NoError”) on query for SOA or NS for *Child Zone*.

In addition, this test case will output a message if transport over IPv4 or IPv6 has been disabled.

▼ 7.4.3. Errors

This test case may produce the following errors:

- [DNS_INCONSISTENT_RESPONSES\(ERROR\)](#)
- [ZM_CN01_MISSING_NS_RECORD_UDP\(ERROR\)](#)
- [ZM_CN01_MISSING_SOA_RECORD_UDP\(ERROR\)](#)
- [ZM_CN01_NO_RESPONSE_NS_QUERY_UDP\(ERROR\)](#)
- [ZM_CN01_NO_RESPONSE_SOA_QUERY_UDP\(ERROR\)](#)
- [ZM_CN01_NO_RESPONSE_UDP\(ERROR\)](#)
- [ZM_CN01_NS_RECORD_NOT_AA_UDP\(ERROR\)](#)
- [ZM_CN01_SOA_RECORD_NOT_AA_UDP\(ERROR\)](#)
- [ZM_CN01_UNEXPECTED_RCODE_NS_QUERY_UDP\(ERROR\)](#)
- [ZM_CN01_UNEXPECTED_RCODE_SOA_QUERY_UDP\(ERROR\)](#)
- [ZM_CN01_WRONG_NS_RECORD_UDP\(ERROR\)](#)
- [ZM_CN01_WRONG_SOA_RECORD_UDP\(ERROR\)](#)

▼ 7.4.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.4.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.4.6. Test suites

This test case is used in the following test suite(s):

- [Authoritative DNS Service](#)

7.5. dns-connectivity02 - TCP connectivity to name servers

7.5.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.5.2. Description

Note: the severity levels of one or more error codes for this test case have been changed from the default.

This test case comes from version v2023.1.4 of Zonemaster. For more information, please refer to [the documentation for this test case](#).

Objective

TCP is a protocol to reach a general purpose name server hosting a zone, “All general-purpose DNS implementations MUST support [...] TCP transport” ([RFC 7766](#), section 5).

This Test Case will verify if the name servers of *Child Zone* are reachable over TCP. The name servers tested are both those in the delegation of *Child Zone* and those in the NS records in the *Child Zone* itself.

This Test Case will mimic the tests done by [Connectivity01](#), but over TCP instead:

- Name Server responding to a query.
- Name Server including SOA record of *Child Zone* in the answer section in the response on a SOA query for *Child Zone*.
- Name Server including NS record of *Child Zone* in the answer section in the response on an NS query for *Child Zone*.
- Name Server setting the AA flag in a response with SOA or NS in answer section.
- Name Server responding with expected [RCODE Name](#) (“NoError”) on query for SOA or NS for *Child Zone*.

▼ 7.5.3. Errors

This test case may produce the following errors:

- [DNS_INCONSISTENT_RESPONSES\(ERROR\)](#)
- [ZM_CN02_MISSING_NS_RECORD_TCP\(ERROR\)](#)
- [ZM_CN02_MISSING_SOA_RECORD_TCP\(ERROR\)](#)
- [ZM_CN02_NO_RESPONSE_NS_QUERY_TCP\(ERROR\)](#)
- [ZM_CN02_NO_RESPONSE_SOA_QUERY_TCP\(ERROR\)](#)
- [ZM_CN02_NO_RESPONSE_TCP\(ERROR\)](#)
- [ZM_CN02_NS_RECORD_NOT_AA_TCP\(ERROR\)](#)
- [ZM_CN02_SOA_RECORD_NOT_AA_TCP\(ERROR\)](#)
- [ZM_CN02_UNEXPECTED_RCODE_NS_QUERY_TCP\(ERROR\)](#)
- [ZM_CN02_UNEXPECTED_RCODE_SOA_QUERY_TCP\(ERROR\)](#)
- [ZM_CN02_WRONG_NS_RECORD_TCP\(ERROR\)](#)
- [ZM_CN02_WRONG_SOA_RECORD_TCP\(ERROR\)](#)

▼ 7.5.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.5.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.5.6. Test suites

This test case is used in the following test suite(s):

- [Authoritative DNS Service](#)

7.6. dns-connectivity03 - AS Diversity

7.6.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.6.2. Description

Note: the severity levels of one or more error codes for this test case have been changed from the default.

This test case comes from version v2023.1.4 of Zonemaster. For more information, please refer to [the documentation for this test case](#).

Objective

The objective in this test is to verify that all IP addresses of the domain's authoritative name servers are announced from different ASNs (autonomous system number). See [RFC 1930](#) and [Wikipedia](#) for an explanation of AS (autonomous system).

This test is done separately on IPv4 and IPv6, and both must match the criterion.

[RFC 2182](#), section 3.1, clearly specifies that distinct authoritative name servers for a child domain should be placed in different topological and geographical locations. The objective is to minimise the likelihood of a single failure disabling all of them.

▼ 7.6.3. Errors

This test case may produce the following errors:

- [DNS_INCONSISTENT_RESPONSES\(ERROR\)](#)
- [ZM_EMPTY ASN_SET\(ERROR\)](#)
- [ZM_ERROR ASN_DATABASE\(ERROR\)](#)
- [ZM_IPV4_ONE ASN\(ERROR\)](#)
- [ZM_IPV6_ONE ASN\(ERROR\)](#)

▼ 7.6.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.6.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.6.6. Test suites

This test case is used in the following test suite(s):

- [Authoritative DNS Service](#)
-

7.7. dns-consistency02 - SOA RNAME consistency

7.7.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.7.2. Description

Note: the severity levels of one or more error codes for this test case have been changed from the default.

This test case comes from version v2023.1.4 of Zonemaster. For more information, please refer to [the documentation for this test case](#).

Objective

All authoritative name servers must serve the same SOA record for the tested domain (section 4.2.1 of [RFC 1034](#)). As per section 3.3.13 of [RFC 1035](#), the RNAME field in the SOA RDATA refers to the administrative contact. An inconsistency in the administrative contact for the domain might result in operational failures being reported to different persons.

The objective of this test is to verify that the administrative contact is consistent between different authoritative name servers.

▼ 7.7.3. Errors

This test case may produce the following errors:

- [DNS_INCONSISTENT_RESPONSES\(ERROR\)](#)
- [ZM_MULTIPLE_SOAR NAMES\(ERROR\)](#)
- [ZM_NO_RESPONSE\(ERROR\)](#)
- [ZM_NO_RESPONSE_SOA_QUERY\(ERROR\)](#)

▼ 7.7.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.7.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.7.6. Test suites

This test case is used in the following test suite(s):

- [Authoritative DNS Service](#)
-

7.8. dns-consistency03 - SOA timers consistency

7.8.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.8.2. Description

Note: the severity levels of one or more error codes for this test case have been changed from the default.

This test case comes from version v2023.1.4 of Zonemaster. For more information, please refer to [the documentation for this test case](#).

Objective

All SOA record timer fields must be consistent across all authoritative name servers. An inconsistency in these fields might result in operational inconsistencies for the designated zone.

There are other test cases that provide consistency tests for the other SOA fields:

- [CONSISTENCY01](#) (SOA Serial)
- [CONSISTENCY02](#) (RNAME)
- [CONSISTENCY06](#) (MNAME)

▼ 7.8.3. Errors

This test case may produce the following errors:

- [DNS_INCONSISTENT_RESPONSES\(ERROR\)](#)
- [ZM_MULTIPLE_SOATIME_PARAMETER_SET\(ERROR\)](#)
- [ZM_NO_RESPONSE\(ERROR\)](#)
- [ZM_NO_RESPONSE_SOA_QUERY\(ERROR\)](#)

▼ 7.8.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.8.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.8.6. Test suites

This test case is used in the following test suite(s):

- [Authoritative DNS Service](#)
-

7.9. dns-consistency04 - Name server NS consistency

7.9.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.9.2. Description

Note: the severity levels of one or more error codes for this test case have been changed from the default.

This test case comes from version v2023.1.4 of Zonemaster. For more information, please refer to [the documentation for this test case](#).

Objective

All authoritative name servers must serve the same NS record set for the tested domain, child zone ([RFC 1034](#), section 4.2.2).

Any inconsistencies in NS records described in [RFC 1035](#), section 3.3.11, might result in operational failures.

The objective of this test is to verify that the NS records are consistent between all authoritative name servers of the child zone.

Two NS RR sets are considered to be equal if both sets have the same number of NS records, and for each NS record in one of the sets there is exactly one NS record with identical owner name, class, TTL and RDATA in the other NS set.

▼ 7.9.3. Errors

This test case may produce the following errors:

- [DNS_INCONSISTENT_RESPONSES\(ERROR\)](#)
- [ZM_MULTIPLE_NS_SET\(ERROR\)](#)
- [ZM_NO_RESPONSE\(ERROR\)](#)
- [ZM_NO_RESPONSE_NS_QUERY\(ERROR\)](#)

▼ 7.9.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.9.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.9.6. Test suites

This test case is used in the following test suite(s):

- [Authoritative DNS Service](#)
-

7.10. dns-consistency05 - Consistency between glue and authoritative data

7.10.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.10.2. Description

Note: the severity levels of one or more error codes for this test case have been changed from the default.

This test case comes from version v2023.1.4 of Zonemaster. For more information, please refer to [the documentation for this test case](#).

Objective

For name servers that have IP addresses listed as glue, the IP addresses must match the authoritative A and AAAA records for that host. This is an IANA [name server requirement](#).

The objective of this test is to verify that the [glue records](#) in the delegation are consistent with authoritative data.

▼ 7.10.3. Errors

This test case may produce the following errors:

- [DNS_INCONSISTENT_RESPONSES\(ERROR\)](#)
- [ZM_CHILD_NS_FAILED\(ERROR\)](#)
- [ZM_CHILD_ZONE_LAME\(ERROR\)](#)
- [ZM_EXTRA_ADDRESS_CHILD\(ERROR\)](#)
- [ZM_IN_BAILIWICK_ADDR_MISMATCH\(ERROR\)](#)
- [ZM_NO_RESPONSE\(ERROR\)](#)
- [ZM_OUT_OF_BAILIWICK_ADDR_MISMATCH\(ERROR\)](#)

▼ 7.10.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.10.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.10.6. Test suites

This test case is used in the following test suite(s):

- [Authoritative DNS Service](#)
-

7.11. dns-consistency06 - SOA MNAME consistency

7.11.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.11.2. Description

Note: the severity levels of one or more error codes for this test case have been changed from the default.

This test case comes from version v2023.1.4 of Zonemaster. For more information, please refer to [the documentation for this test case](#).

Objective

All authoritative name servers must serve the same SOA record (section 4.2.1) of [RFC 1034](#) for the tested domain. As per section 3.3.13 of [RFC 1035](#) the MNAME field in the SOA RDATA refers to the name of “the name server that was the original or primary source of data for this zone”. Inconsistency in MNAME of the domain might result in operational failures for applications that uses MNAME.

▼ 7.11.3. Errors

This test case may produce the following errors:

- [DNS_INCONSISTENT_RESPONSES\(ERROR\)](#)
- [ZM_MULTIPLE_SOAMNAMES\(ERROR\)](#)
- [ZM_NO_RESPONSE\(ERROR\)](#)
- [ZM_NO_RESPONSE_SOA_QUERY\(ERROR\)](#)

▼ 7.11.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.11.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.11.6. Test suites

This test case is used in the following test suite(s):

- [Authoritative DNS Service](#)
-

7.12. dns-delegation01 - Minimum number of name servers

7.12.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.12.2. Description

Note: the severity levels of one or more error codes for this test case have been changed from the default.

This test case comes from version v2023.1.4 of Zonemaster. For more information, please refer to [the documentation for this test case](#).

Objective

Section 4.1 of [RFC 1034](#) specifies that there must be a minimum of two name servers for a domain. This test is done to verify this condition.

The RFC ([RFC 1034](#)) predates IPv6. Since IPv4 and IPv6 work as separate networks, this test case has been extended to test for two name servers that resolve into IPv4 addresses and IPv6 addresses respectively.

Both [RFC 3901](#) (section 3) and [RFC 4472](#) (section 1.3) states that a domain (zone) should be available over IPv4 for the time being. Therefore, it is by the default level in this test case considered to be more problematic not being available over IPv4 than not being available over IPv6.

▼ 7.12.3. Errors

This test case may produce the following errors:

- [DNS_INCONSISTENT_RESPONSES\(ERROR\)](#)
- [ZM_NOT_ENOUGH_IPV4_NS_CHILD\(ERROR\)](#)
- [ZM_NOT_ENOUGH_IPV4_NS_DEL\(ERROR\)](#)
- [ZM_NOT_ENOUGH_IPV6_NS_CHILD\(ERROR\)](#)
- [ZM_NOT_ENOUGH_IPV6_NS_DEL\(ERROR\)](#)
- [ZM_NOT_ENOUGH_NS_CHILD\(ERROR\)](#)
- [ZM_NOT_ENOUGH_NS_DEL\(ERROR\)](#)
- [ZM_NO_IPV4_NS_CHILD\(ERROR\)](#)
- [ZM_NO_IPV4_NS_DEL\(ERROR\)](#)
- [ZM_NO_IPV6_NS_CHILD\(ERROR\)](#)
- [ZM_NO_IPV6_NS_DEL\(ERROR\)](#)

▼ 7.12.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.12.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.12.6. Test suites

This test case is used in the following test suite(s):

- [Authoritative DNS Service](#)

7.13. dns-delegation02 - Name servers must have distinct IP addresses

7.13.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.13.2. Description

This test case comes from version v2023.1.4 of Zonemaster. For more information, please refer to [the documentation for this test case](#).

Objective

If the domain's name servers use several different names, they can all be using the same IP address. This may be due to a configuration error, or a workaround for a certain policy restriction. This test case checks that the name servers used do not reuse the same IP addresses.

Section 4.1 of [RFC 1034](#) says at least two name servers must be used for a delegation.

▼ 7.13.3. Errors

This test case may produce the following errors:

- [DNS_INCONSISTENT_RESPONSES\(ERROR\)](#)
- [ZM_CHILD_NS_SAME_IP\(ERROR\)](#)
- [ZM_DEL_NS_SAME_IP\(ERROR\)](#)
- [ZM_SAME_IP_ADDRESS\(ERROR\)](#)

▼ 7.13.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.13.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.13.6. Test suites

This test case is used in the following test suite(s):

- [Authoritative DNS Service](#)
-

7.14. dns-delegation03 - No truncation of referrals

7.14.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.14.2. Description

Note: the severity levels of one or more error codes for this test case have been changed from the default.

This test case comes from version v2023.1.4 of Zonemaster. For more information, please refer to [the documentation for this test case](#).

Objective

The Domain Name System defaults to using UDP for queries and answers with a DNS payload limit of 512 octets (bytes). Larger replies cause an initial truncation indication leading to a subsequent handling via TCP with substantially higher overhead. EDNS0 is used to allow for larger UDP responses thus reducing the need for use of TCP.

But [IANA](#) still maintains that referrals from the parent zone name servers must fit into a non-EDNS0 UDP DNS packet.

▼ 7.14.3. Errors

This test case may produce the following errors:

- [DNS_INCONSISTENT_RESPONSES\(ERROR\)](#)
- [ZM_REFERRAL_SIZE_TOO_LARGE\(ERROR\)](#)

▼ 7.14.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.14.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.14.6. Test suites

This test case is used in the following test suite(s):

- [Authoritative DNS Service](#)
-

7.15. dns-delegation04 - Name server is authoritative

7.15.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.15.2. Description

This test case comes from version v2023.1.4 of Zonemaster. For more information, please refer to [the documentation for this test case](#).

Objective

Subsection 6.1 of [RFC 2181](#) specifies that the nameservers must answer authoritatively for the domain. Answers to queries to the name servers for the designated zone must have the “AA” bit set.

▼ 7.15.3. Errors

This test case may produce the following errors:

- [DNS INCONSISTENT RESPONSES \(ERROR\)](#)
- [ZM IS NOT AUTHORITATIVE \(WARNING\)](#)

▼ 7.15.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.15.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.15.6. Test suites

This test case is used in the following test suite(s):

- [Authoritative DNS Service](#)
-

7.16. dns-delegation05 - Name server must not point at CNAME alias

7.16.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.16.2. Description

Note: the severity levels of one or more error codes for this test case have been changed from the default.

This test case comes from version v2023.1.4 of Zonemaster. For more information, please refer to [the documentation for this test case](#).

Objective

Name servers for a zone are defined in NS records. An NS record points at a name, i.e. the RDATA for an NS record is a domain name. That name is the name of the name server. [RFC 2181](#), section 10.3, states that the name of the name server must not itself point at a CNAME.

The objective of this test is to verify that name servers of the tested domain (zone) do not point at CNAME records.

▼ 7.16.3. Errors

This test case may produce the following errors:

- [DNS_INCONSISTENT_RESPONSES\(ERROR\)](#)
- [ZM_NO_RESPONSE\(ERROR\)](#)
- [ZM_NS_IS_CNAME\(ERROR\)](#)
- [ZM_UNEXPECTED_RCODE\(WARNING\)](#)

▼ 7.16.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.16.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.16.6. Test suites

This test case is used in the following test suite(s):

- [Authoritative DNS Service](#)
-

7.17. dns-delegation07 - Parent glue name records present in child

7.17.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.17.2. Description

This test case comes from version v2023.1.4 of Zonemaster. For more information, please refer to [the documentation for this test case](#).

Objective

If the list of name servers for a domain obtained from its parent are not found in its child zone, then it leads to an inconsistency (section 2.3 of [RIPE-114](#))

▼ 7.17.3. Errors

This test case may produce the following errors:

- [DNS_INCONSISTENT_RESPONSES\(ERROR\)](#)
- [ZM_EXTRA_NAME_PARENT\(ERROR\)](#)
- [ZM_TOTAL_NAME_MISMATCH\(ERROR\)](#)

▼ 7.17.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.17.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.17.6. Test suites

This test case is used in the following test suite(s):

- [Authoritative DNS Service](#)
-

7.18. dns-nameserver01 - A name server should not be a recursor

7.18.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.18.2. Description

Note: the severity levels of one or more error codes for this test case have been changed from the default.

This test case comes from version v2023.1.4 of Zonemaster. For more information, please refer to [the documentation for this test case](#).

Objective

To ensure consistency in DNS, an authoritative name server should not be configured to do recursive lookups. Also, open recursive resolvers are considered bad internet practice due to their capability of assisting in large scale DDoS attacks. The introduction to [RFC 5358](#) elaborates on mixing recursor and authoritative functionality, and the issue is further elaborated by [D.J. Bernstein](#).

Section 2.5 of [RFC 2870](#) have very specific requirement on disabling recursion functionality on root name servers.

▼ 7.18.3. Errors

This test case may produce the following errors:

- [DNS_INCONSISTENT_RESPONSES\(ERROR\)](#)
- [ZM_IS_A_RECURSOR\(ERROR\)](#)
- [ZM_NO_RESPONSE\(ERROR\)](#)

▼ 7.18.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.18.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.18.6. Test suites

This test case is used in the following test suite(s):

- [Authoritative DNS Service](#)

7.19. dns-nameserver02 - Test of EDNS0 support

7.19.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.19.2. Description

Note: the severity levels of one or more error codes for this test case have been changed from the default.

This test case comes from version v2023.1.4 of Zonemaster. For more information, please refer to [the documentation for this test case](#).

Objective

EDNS(0) is a mechanism to announce capabilities of a DNS implementation, and is now basically required by any new functionality in DNS such as DNSSEC. EDNS(0) is standardized in [RFC 6891](#).

This test case checks that all name servers has the capability to do EDNS(0) or if not, correctly replies to queries containing EDNS (OPT record).

Servers not supporting EDNS(0) must return FORMERR ([RFC 6891, section 7](#)):

Responders that choose not to implement the protocol extensions defined in this document MUST respond with a return code (RCODE) of FORMERR to messages containing an OPT record in the additional section and MUST NOT include an OPT record in the response.

Servers supporting EDNS(0) must reply with EDNS(0) ([RFC 6891, section 6.1.1](#)):

If an OPT record is present in a received request, compliant responders MUST include an OPT record in their respective responses.

To eliminating the risk of falsely classifying the server as not supporting EDNS due e.g. firewall issues, the UDP buffer size is set to 512 bytes (octets).

▼ 7.19.3. Errors

This test case may produce the following errors:

- [DNS_INCONSISTENT_RESPONSES\(ERROR\)](#)
- [ZM_BREAKS_ON_EDNS\(ERROR\)](#)
- [ZM_EDNS_RESPONSE_WITHOUT_EDNS\(ERROR\)](#)
- [ZM_EDNS_VERSION_ERROR\(ERROR\)](#)
- [ZM_NO_EDNS_SUPPORT\(ERROR\)](#)
- [ZM_NO_RESPONSE\(ERROR\)](#)
- [ZM_NS_ERROR\(ERROR\)](#)

▼ 7.19.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.19.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.19.6. Test suites

This test case is used in the following test suite(s):

- [Authoritative DNS Service](#)
-

7.20. dns-nameserver04 - Same source address

7.20.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.20.2. Description

Note: the severity levels of one or more error codes for this test case have been changed from the default.

This test case comes from version v2023.1.4 of Zonemaster. For more information, please refer to [the documentation for this test case](#).

Objective

Responses from the authoritative name servers must contain same source IP address as the destination IP address of the initial query. This has been clarified in section 4 of [RFC 2181](#).

▼ 7.20.3. Errors

This test case may produce the following errors:

- [DNS_INCONSISTENT_RESPONSES\(ERROR\)](#)
- [ZM_DIFFERENT_SOURCE_IP\(ERROR\)](#)

▼ 7.20.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.20.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.20.6. Test suites

This test case is used in the following test suite(s):

- [Authoritative DNS Service](#)
-

7.21. dns-nameserver05 - Behaviour against AAAA query

7.21.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.21.2. Description

Note: the severity levels of one or more error codes for this test case have been changed from the default.

This test case comes from version v2023.1.4 of Zonemaster. For more information, please refer to [the documentation for this test case](#).

Objective

Older implementations of authoritative name servers have shown different misbehaviours trying to answer queries for AAAA records, as described in [RFC 4074](#). This test case is intended to find out if the name server authoritative for the domain shows any of these behaviours.

▼ 7.21.3. Errors

This test case may produce the following errors:

- [DNS_INCONSISTENT_RESPONSES\(ERROR\)](#)
- [ZM_AAAA_BAD_RDATA\(ERROR\)](#)
- [ZM_AAAA_QUERY_DROPPED\(ERROR\)](#)
- [ZM_AAAA_UNEXPECTED_RCODE\(ERROR\)](#)
- [ZM_A_UNEXPECTED_RCODE\(ERROR\)](#)
- [ZM_NO_RESPONSE\(ERROR\)](#)

▼ 7.21.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.21.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.21.6. Test suites

This test case is used in the following test suite(s):

- [Authoritative DNS Service](#)
-

7.22. dns-nameserver06 - NS can be resolved

7.22.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.22.2. Description

This test case comes from version v2023.1.4 of Zonemaster. For more information, please refer to [the documentation for this test case](#).

Objective

All name servers names listed for a delegation must be resolvable in DNS. If they are not resolvable using DNS this is a sign of misconfiguration, and raises the risk of unreachability for the domain. It could also lower the performance for any resolver trying to resolve the name.

The objective of this test is to resolve the domain using all the listed name servers used in the delegation. More information about resolver behavior is in section 7 of [RFC 1035](#).

▼ 7.22.3. Errors

This test case may produce the following errors:

- [DNS_INCONSISTENT_RESPONSES\(ERROR\)](#)
- [ZM_CAN_NOT_BE_RESOLVED\(ERROR\)](#)
- [ZM_NO_RESOLUTION\(ERROR\)](#)

▼ 7.22.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.22.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.22.6. Test suites

This test case is used in the following test suite(s):

- [Authoritative DNS Service](#)
-

7.23. dns-nameserver08 - Testing QNAME case insensitivity

7.23.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.23.2. Description

This test case comes from version v2023.1.4 of Zonemaster. For more information, please refer to [the documentation for this test case](#).

Objective

The DNS standards require that nameservers treat names with case insensitivity. That is, the names example.com and EXAMPLE.COM should resolve to the same IP address. However, in the response, most nameservers echo back the name as it appeared in the request, preserving the original case.

Therefore, another way to add entropy to requests is to randomly vary the case of letters in domain names queried. This technique, also known as “0x20” because bit 0x20 is used to set the case of US-ASCII letters, was first proposed in the [IETF internet draft](#) Use of Bit 0x20 in DNS Labels to Improve Transaction Identity. With this technique, the nameserver response must match not only the query name, but the case of every letter in the name string; for example, wWw.eXaMpLe.CoM or WwW.ExamPLe.COm. This may add little or no entropy to queries for the top-level and root domains, but it's effective for most hostnames.

▼ 7.23.3. Errors

This test case may produce the following errors:

- [DNS_INCONSISTENT_RESPONSES \(ERROR\)](#)
- [ZM_QNAME_CASE_INSENSITIVE \(WARNING\)](#)

▼ 7.23.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.23.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.23.6. Test suites

This test case is used in the following test suite(s):

- [Authoritative DNS Service](#)
-

7.24. dns-nameserver09 - Testing QNAME case sensitivity

7.24.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.24.2. Description

This test case comes from version v2023.1.4 of Zonemaster. For more information, please refer to [the documentation for this test case](#).

Objective

There have been cases where the nameservers respond with complete case-sensitivity (in violation of the DNS standards): that is, they match the exact case of the name in the response; but return different results for equivalent names with different cases in the request (typically NXDOMAIN).

▼ 7.24.3. Errors

This test case may produce the following errors:

- [DNS_INCONSISTENT_RESPONSES \(ERROR\)](#)
- [ZM_CASE_QUERIES_RESULTS_DIFFER \(ERROR\)](#)
- [ZM_CASE_QUERY_DIFFERENT_ANSWER \(WARNING\)](#)
- [ZM_CASE_QUERY_DIFFERENT_RC \(WARNING\)](#)
- [ZM_CASE_QUERY_NO_ANSWER \(WARNING\)](#).

▼ 7.24.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.24.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.24.6. Test suites

This test case is used in the following test suite(s):

- [Authoritative DNS Service](#)
-

7.25. dns-nameserver10 - Test for undefined EDNS version

7.25.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.25.2. Description

Note: the severity levels of one or more error codes for this test case have been changed from the default.

This test case comes from version v2023.1.4 of Zonemaster. For more information, please refer to [the documentation for this test case](#).

Objective

EDNS ([RFC 6891](#)) is a mechanism to announce capabilities of a DNS implementation, and is required by new functionality in DNS such as DNSSEC ([RFC 4033](#), section 3).

[RFC 6891](#), section 6.1.3, states that if a nameserver has implemented EDNS but has not implemented the version level of the request, then it MUST respond with RCODE “BADVERS”. Only version “0” has been defined for EDNS.

Note that RCODE “BADVERS” is an extended RCODE which is calculated from the combination of the normal RCODE field in the DNS package header ([RFC 1035](#), section 4.1.1) and the OPT record EXTENDED-RCODE field ([RFC 6891](#), section 6.1.3). Also see [IANA RCODE Registry](#).

▼ 7.25.3. Errors

This test case may produce the following errors:

- [DNS_INCONSISTENT_RESPONSES\(ERROR\)](#)
- [ZM_N10_EDNS_RESPONSE_ERROR\(ERROR\)](#)
- [ZM_N10_NO_RESPONSE_EDNS1_QUERY\(ERROR\)](#)
- [ZM_N10_UNEXPECTED_RCODE\(ERROR\)](#)

▼ 7.25.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.25.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.25.6. Test suites

This test case is used in the following test suite(s):

- [Authoritative DNS Service](#)
-

7.26. dns-nameserver11 - Test for unknown EDNS OPTION-CODE

7.26.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.26.2. Description

Note: the severity levels of one or more error codes for this test case have been changed from the default.

This test case comes from version v2023.1.4 of Zonemaster. For more information, please refer to [the documentation for this test case](#).

Objective

EDNS is a mechanism to announce capabilities of a DNS implementation, and is now basically required by any new functionality in DNS such as DNSSEC ([RFC 6891](#)).

[RFC 6891](#), section 6.1.2, states that any OPTION-CODE values not understood by a responder or requestor MUST be ignored. Unknown OPTION-CODE values must be processed as though the OPTION-CODE was not even there.

In this test case, we will query with an unknown EDNS OPTION-CODE and expect that the OPTION-CODE is not present in the response for the query.

▼ 7.26.3. Errors

This test case may produce the following errors:

- [DNS_INCONSISTENT_RESPONSES\(ERROR\)](#)
- [ZM_N11_NO_EDNS\(ERROR\)](#)
- [ZM_N11_NO_RESPONSE\(ERROR\)](#)
- [ZM_N11 RETURNS UNKNOWN_OPTION_CODE\(ERROR\)](#)
- [ZM_N11_UNEXPECTED_ANSWER_SECTION\(ERROR\)](#)
- [ZM_N11_UNEXPECTED_RCODE\(ERROR\)](#)
- [ZM_N11_UNSET_AA\(ERROR\)](#)

▼ 7.26.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.26.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.26.6. Test suites

This test case is used in the following test suite(s):

- [Authoritative DNS Service](#)

7.27. dns-nameserver12 - Test for unknown EDNS flags

7.27.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.27.2. Description

Note: the severity levels of one or more error codes for this test case have been changed from the default.

This test case comes from version v2023.1.4 of Zonemaster. For more information, please refer to [the documentation for this test case](#).

Objective

EDNS is a mechanism to announce capabilities of a dns implementation, and is now basically required by any new functionality in dns such as DNSSEC ([RFC 6891](#)).

[RFC 6891](#), section 6.1.4, states that “Z” flag bits must be set to zero by senders and ignored by receiver.

[IANA](#) lists the flags in the [EDNS Header Flags](#) assignment list.

In this test case, the query will have an unknown EDNS flag set, i.e. one of the Z flag bits set to “1”, and it is expected that all “Z” bits to be clear in the response (set to “0”).

▼ 7.27.3. Errors

This test case may produce the following errors:

- [DNS_INCONSISTENT_RESPONSES\(ERROR\)](#)
- [ZM_NO_EDNS_SUPPORT\(ERROR\)](#)
- [ZM_NO_RESPONSE\(ERROR\)](#)
- [ZM_NS_ERROR\(ERROR\)](#)
- [ZM_Z_FLAGS_NOTCLEAR\(ERROR\)](#)

▼ 7.27.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.27.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.27.6. Test suites

This test case is used in the following test suite(s):

- [Authoritative DNS Service](#)
-

7.28. dns-nameserver13 - Test for truncated response on EDNS query

7.28.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.28.2. Description

Note: the severity levels of one or more error codes for this test case have been changed from the default.

This test case comes from version v2023.1.4 of Zonemaster. For more information, please refer to [the documentation for this test case](#).

Objective

EDNS is a mechanism to announce capabilities of a DNS implementation, and is now basically required by any new functionality in DNS such as DNSSEC ([RFC 6891](#)).

[RFC 6891, section 7](#) states that an OPT record must be included in a truncated response, if the query includes an OPT pseudo record.

This Test Case will try to verify that if the response to a query with an OPT record is truncated, then the response will contain an OPT record.

To trigger a truncated response, the OPT pseudo record ‘DO’ bit is set and the buffer size is limited to 512 bytes. If the zone is not signed with DNSSEC, the response will probably not be truncated anyway.

▼ 7.28.3. Errors

This test case may produce the following errors:

- [DNS_INCONSISTENT_RESPONSES \(ERROR\)](#)
- [ZM_MISSING_OPT_IN_TRUNCATED \(ERROR\)](#)
- [ZM_NO_EDNS_SUPPORT \(ERROR\)](#)
- [ZM_NO_RESPONSE \(ERROR\)](#)
- [ZM_NS_ERROR \(ERROR\)](#)

▼ 7.28.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.28.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.28.6. Test suites

This test case is used in the following test suite(s):

- [Authoritative DNS Service](#)

7.29. dns-syntax05 - Misuse of '@' character in the SOA RNAME field

7.29.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.29.2. Description

Note: the severity levels of one or more error codes for this test case have been changed from the default.

This test case comes from version v2023.1.4 of Zonemaster. For more information, please refer to [the documentation for this test case](#).

Objective

The SOA RNAME field does not allow the '@' characters to be used for describing a mailbox. The first dot ('.') is thus translated into the '@' character. This is a common mistake. The rules are defined in [RFC 1035](#).

▼ 7.29.3. Errors

This test case may produce the following errors:

- [DNS_INCONSISTENT_RESPONSES \(ERROR\)](#)
- [ZM_NO_RESPONSE_SOA_QUERY \(ERROR\)](#)
- [ZM_RNAME_MISUSED_AT_SIGN \(ERROR\)](#)

▼ 7.29.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.29.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.29.6. Test suites

This test case is used in the following test suite(s):

- [Authoritative DNS Service](#)
-

7.30. dns-syntax06 - No illegal characters in the SOA RNAME field

7.30.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.30.2. Description

Note: the severity levels of one or more error codes for this test case have been changed from the default.

This test case comes from version v2023.1.4 of Zonemaster. For more information, please refer to [the documentation for this test case](#).

Objective

The SOA RNAME field is a mailbox address. The SOA RNAME field is defined in [RFC 1035](#), section 3.3.13 and in [RFC 1912](#), section 2.2. The RNAME field should follow the rules of an e-mail address also defined in [RFC 5322](#), section 3.4.1.

▼ 7.30.3. Errors

This test case may produce the following errors:

- [DNS_INCONSISTENT_RESPONSES\(ERROR\)](#)
- [ZM_NO_RESPONSE\(ERROR\)](#)
- [ZM_NO_RESPONSE_SOA_QUERY\(ERROR\)](#)
- [ZM_RNAME_MAIL_DOMAIN_INVALID\(ERROR\)](#)
- [ZM_RNAME_MAIL_DOMAIN_LOCALHOST\(ERROR\)](#)
- [ZM_RNAME_MAIL_ILLEGAL_CNAME\(ERROR\)](#)
- [ZM_RNAME_RFC822_INVALID\(ERROR\)](#)

▼ 7.30.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.30.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.30.6. Test suites

This test case is used in the following test suite(s):

- [Authoritative DNS Service](#)
-

7.31. dns-syntax07 - No illegal characters in the SOA MNAME field

7.31.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.31.2. Description

Note: the severity levels of one or more error codes for this test case have been changed from the default.

This test case comes from version v2023.1.4 of Zonemaster. For more information, please refer to [the documentation for this test case](#).

Objective

The SOA MNAME field is a hostname. Hostnames are valid according to the rules defined in [RFC 952](#), in section 2.1 in [RFC 1123](#), section 11 in [RFC 2182](#) and section 2 and 5 in [RFC 3696](#). Newer RFCs may override some rules defined in earlier documents.

▼ 7.31.3. Errors

This test case may produce the following errors:

- [DNS_INCONSISTENT_RESPONSES \(ERROR\)](#)
- [ZM_MNAME_DISCOURAGED_DOUBLE_DASH \(WARNING\)](#)
- [ZM_MNAME_NON_ALLOWED_CHARS \(WARNING\)](#)
- [ZM_MNAME_NUMERIC_TLD \(WARNING\)](#)
- [ZM_NO_RESPONSE_SOA_QUERY \(ERROR\)](#)

▼ 7.31.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.31.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.31.6. Test suites

This test case is used in the following test suite(s):

- [Authoritative DNS Service](#)
-

7.32. dns-zone07 - SOA master is not an alias

7.32.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.32.2. Description

Note: the severity levels of one or more error codes for this test case have been changed from the default.

This test case comes from version v2023.1.4 of Zonemaster. For more information, please refer to [the documentation for this test case](#).

Objective

Any NS type record should not be a CNAME. The SOA MNAME should in this respect not be a CNAME.

Quote from 2.4 in [RFC 1912](#):

Having NS records pointing to a CNAME is bad and may conflict badly with current BIND servers.

The SOA MNAME field is described in section 3.3.13 in [RFC 1035](#).

The [RIPE-203](#) recommendation for the minimum value 2 days, but the negative caching is now the norm. DNSCheck has a recommended value of between 300 seconds (5 minutes) and 86400 seconds (1 day).

▼ 7.32.3. Errors

This test case may produce the following errors:

- [DNS_INCONSISTENT_RESPONSES \(ERROR\)](#)
- [ZM_MNAME_HAS_NO_ADDRESS \(WARNING\)](#)
- [ZM_NO_RESPONSE_SOA_QUERY \(ERROR\)](#)

▼ 7.32.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.32.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.32.6. Test suites

This test case is used in the following test suite(s):

- [Authoritative DNS Service](#)

7.33. dns-zone10 - No multiple SOA records

7.33.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.33.2. Description

Note: the severity levels of one or more error codes for this test case have been changed from the default.

This test case comes from version v2023.1.4 of Zonemaster. For more information, please refer to [the documentation for this test case](#).

Objective

The SOA record is crucial for the DNS zone and “exactly one SOA RR should be present at the top of the zone” ([RFC 1035](#), section 5.2). This test case will verify that the zone of the domain to be tested return exactly one SOA record.

▼ 7.33.3. Errors

This test case may produce the following errors:

- [DNS_INCONSISTENT_RESPONSES\(ERROR\)](#)
- [ZM_MULTIPLE_SOAs\(ERROR\)](#)
- [ZM_NO_RESPONSE\(ERROR\)](#)
- [ZM_NO_SOAs_IN_RESPONSE\(ERROR\)](#)
- [ZM_WRONG_SOAs\(ERROR\)](#)

▼ 7.33.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.33.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.33.6. Test suites

This test case is used in the following test suite(s):

- [Authoritative DNS Service](#)
-

7.34. dns-zz-idna2008-compliance - IDNA2008 compliance check

7.34.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.34.2. Description

In addition to the other tests case in this suite, which come from Zonemaster, this test case exists to confirm that all DNS host names which appear in resource records at the TLD apex conform to the IDNA2008 specifications, described in RFC 5980.

The names that appear in the MNAME and RNAME fields of the TLD SOA record, and in the apex NS records, **MUST** be comprised solely of (a) NR-LDH labels (see Section 2.3.2.2 of RFC 5980) or (b) IDN labels that conform to the requirements of IDNA2008.

▼ 7.34.3. Errors

This test case may produce the following errors:

- [DNS_IDNA2008_INVALID_MNAME\(ERROR\)](#)
- [DNS_IDNA2008_INVALID_NS_NSDNAME\(ERROR\)](#)
- [DNS_IDNA2008_INVALID_RNAME\(ERROR\)](#)
- [DNS_IDNA2008_QUERY_FAILED\(CRITICAL\)](#)

▼ 7.34.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.34.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.34.6. Test suites

This test case is used in the following test suite(s):

- [Authoritative DNS Service](#)

7.35. dnssec-01 - Legal values for the DS hash digest algorithm

7.35.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.35.2. Description

Note: the severity levels of one or more error codes for this test case have been changed from the default.

This test case comes from version v2023.1.4 of Zonemaster. For more information, please refer to [the documentation for this test case](#).

Objective

The list of allowed Digest Algorithms in a DS record published by the parent is specified by [RFC 8624](#), section 3.3, and is published in the [IANA registry](#) of *DS RR Type Digest Algorithms*. No DS Digest Algorithm values, other than those specified in the RFC and allocated by IANA, should be used in public DNS.

If [RFC 8624](#) and the [IANA registry](#) disagree on the same DS digest algorithm, the RFC takes precedence until the registry has a been updated with a reference to the RFC.

The table of algorithms below is for reference only and is copied from [IANA registry](#). It is here to make it easier to read the steps when symbolic names are given. This is only an excerpt from the table. The full table is available at the IANA registry.

Algorithm number	Algorithm (or description)
0	(Reserved)
1	SHA-1
2	SHA-256
3	GOST R 34.11-94
4	SHA-384
5-255	(Unassigned)

This test case will verify that the Zonemaster implementation has support for the DS digest algorithm of the DS record found, and if not output a message tag. If the support is missing other test cases will not be able to verify that DS record.

▼ 7.35.3. Errors

This test case may produce the following errors:

- [DNS_INCONSISTENT_RESPONSES \(ERROR\)](#)
- [ZM_DS01_DS_ALGO_2_MISSING \(ERROR\)](#)
- [ZM_DS01_DS_ALGO_DEPRECATED \(ERROR\)](#)
- [ZM_DS01_DS_ALGO_NOT_DS \(ERROR\)](#)
- [ZM_DS01_DS_ALGO_RESERVED \(ERROR\)](#)

▼ 7.35.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.35.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.35.6. Test suites

This test case is used in the following test suite(s):

- [DNS Security Extensions \(DNSSEC\)](#)
-

7.36. dnssec-02 - DS must match a valid DNSKEY in the child zone

7.36.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.36.2. Description

Note: the severity levels of one or more error codes for this test case have been changed from the default.

Note: References to “Key Signing Keys” in the description below also refer to Combined Signing Keys, if used.

This test case comes from version v2023.1.4 of Zonemaster. For more information, please refer to [the documentation for this test case](#).

Objective

DNS delegations from a parent to a child are secured with DNSSEC by publishing one or several Delegation Signer (DS) records in the parent zone, along with the NS records for the delegation.

For the secure delegation to work, at least one DS record must match a DNSKEY record in the child zone ([RFC 4035](#), section 5). Each DS record should match a DNSKEY record in the child zone. More than one DS may match the same DNSKEY. The DNSKEY that the DS record refers to must be used to sign the DNSKEY RRset in the child zone ([RFC 4035](#), section 5).

The DNSKEY record that the DS record refers to must have bit 7 (“Zone Key flag”) set in the DNSKEY RR Flags ([RFC 4034](#), section 5.2).

Bit 15 (“Secure Entry Point flag”) on a DNSKEY record signals that it is meant to be a KSK and pointed out by a DS record. It is noted if the DNSKEY record that the DS points to does not have that flag set ([RFC 4034](#), section 2.1.1).

▼ 7.36.3. Errors

This test case may produce the following errors:

- [DNS_INCONSISTENT_RESPONSES\(ERROR\)](#)
- [ZM_DS02_DNSKEY_NOT_FOR_ZONE_SIGNING\(ERROR\)](#)
- [ZM_DS02_DNSKEY_NOT_SEP\(ERROR\)](#)
- [ZM_DS02_DNSKEY_NOT_SIGNED_BY_ANY_DS\(ERROR\)](#)
- [ZM_DS02_NO_DNSKEY_FOR_DS\(ERROR\)](#)
- [ZM_DS02_NO_MATCHING_DNSKEY_RRSIG\(ERROR\)](#)
- [ZM_DS02_NO_MATCH_DS_DNSKEY\(ERROR\)](#)
- [ZM_DS02_NO_VALID_DNSKEY_FOR_ANY_DS\(ERROR\)](#)
- [ZM_DS02_RRSIG_NOT_VALID_BY_DNSKEY\(ERROR\)](#)

▼ 7.36.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.36.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.36.6. Test suites

This test case is used in the following test suite(s):

- [DNS Security Extensions \(DNSSEC\)](#)

7.37. dnssec-03 - Check for too many NSEC3 iterations

7.37.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.37.2. Description

Note: while failure conditions defined in this test case are weaker than those defined in [dnssec-93](#), as of Zonemaster::Engine v5.0.0, this test case emits the [ZM_DS03_NO_DNSSEC_SUPPORT](#) error, which is required to ensure that the TLD zone is properly signed with DNSSEC.

This test case comes from version v2023.1.4 of Zonemaster. For more information, please refer to [the documentation for this test case](#).

Objective

For an authoritative name server an increased number of NSEC3 iterations have a negative impact on performance.

Section 10.3 in [RFC 5155](#) sets a maximum number of iterations depending on the DNSSEC key size - regardless of which algorithm is used.

A zone owner MUST NOT use a value higher than shown in the table below for iterations for the given key size. A resolver MAY treat a response with a higher value as insecure, after the validator has verified that the signature over the NSEC3 RR is correct.

Key Size	Iterations
1024	150
2048	500
4096	2,500

Section 5.3.2 in [RFC 6781](#) describes the consequences for an authoritative name server in more detail, and references the [NSEC Hash Performance](#) study from NLNet Labs.

Choosing a value of 100 iterations is deemed to be a sufficiently costly, yet not excessive, value: In the worst-case scenario, the performance of name servers would be halved, regardless of key size.

▼ 7.37.3. Errors

This test case may produce the following errors:

- [DNS_INCONSISTENT_RESPONSES \(ERROR\)](#)
- [ZM_NO_DNSKEY \(ERROR\)](#)
- [ZM_TOO_MANY_ITERATIONS \(WARNING\)](#)

▼ 7.37.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.37.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.37.6. Test suites

This test case is used in the following test suite(s):

- [DNS Security Extensions \(DNSSEC\)](#)

7.38. dnssec-04 - Check for too short or too long RRSIG lifetimes

7.38.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.38.2. Description

This test case comes from version v2023.1.4 of Zonemaster. For more information, please refer to [the documentation for this test case](#).

Objective

Having RRSIG signature lifetimes last for too long opens up for DNS replay attacks. Having too short RRSIG signature lifetimes is likely to have a major operational impact if the master name server is down for that long.

There is no clear recommendation of the exact validity periods to use with DNSSEC. Shorter validity than 12 hours until expiration will give a serious operational problem just in case of temporary network problems, and longer than 180 days will create wide open holes for replay attacks.

The considerations are described in [RFC6781](#).

▼ 7.38.3. Errors

This test case may produce the following errors:

- [DNS_INCONSISTENT_RESPONSES \(ERROR\)](#)
- [ZM_DURATION_LONG \(WARNING\)](#)
- [ZM_REMAINING_LONG \(WARNING\)](#)
- [ZM_REMAINING_SHORT \(WARNING\)](#)
- [ZM_RRSIG_EXPIRED \(ERROR\)](#)

▼ 7.38.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.38.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.38.6. Test suites

This test case is used in the following test suite(s):

- [DNS Security Extensions \(DNSSEC\)](#)

7.39. dnssec-05 - Check for invalid DNSKEY algorithms

7.39.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.39.2. Description

Note: the severity levels of one or more error codes for this test case have been changed from the default.

This test case comes from version v2023.1.4 of Zonemaster. For more information, please refer to [the documentation for this test case](#).

Objective

A domain name (zone) should only use DNSKEY algorithms that are specified by [RFC 8624](#), section 3.1 and the [IANA registry](#) of *DNSSEC Algorithm Numbers* to be used for DNSSEC signing. A public domain name (zone) should not use private algorithms.

If [RFC 8624](#) and [IANA registry](#) disagree on the same algorithm, the RFC takes precedence until the registry has a been updated with a reference to the RFC.

The table of algorithms below is for reference only and is copied from [IANA registry](#). It is here to make it easier to read the steps when symbolic names are given. This is only an excerpt from the table. The full table is available at [IANA registry](#).

Algorithm number	Algorithm (or description)
0	(Delete DS)
1	RSA/MD5
2	Diffie-Hellman
3	DSA/SHA1
4	(Reserved)
5	RSA/SHA-1
6	DSA-NSEC3-SHA1
7	RSASHA1-NSEC3-SHA1
8	RSA/SHA-256
9	(Reserved)
10	RSA/SHA-512
11	(Reserved)
12	GOST R 34.10-2001
13	ECDSA Curve P-256 with SHA-256
14	ECDSA Curve P-384 with SHA-384
15	Ed25519
16	Ed448
17-122	(Unassigned)
123-251	(Reserved)
252	(Indirect Keys)
253	(Private algorithm)
254	(Private algorithm OID)
255	(Reserved)

▼ 7.39.3. Errors

This test case may produce the following errors:

- [DNS_INCONSISTENT_RESPONSES \(ERROR\)](#)
- [ZM_ALGORITHM_DEPRECATED \(ERROR\)](#)
- [ZM_ALGORITHM_NOT_RECOMMENDED \(ERROR\)](#)
- [ZM_ALGORITHM_NOT_ZONE_SIGN \(ERROR\)](#)
- [ZM_ALGORITHM_PRIVATE \(ERROR\)](#)
- [ZM_ALGORITHM_RESERVED \(ERROR\)](#)

- [ZM_ALGORITHM_UNASSIGNED \(ERROR\)](#)
- [ZM_NO_RESPONSE \(ERROR\)](#)
- [ZM_NO_RESPONSE_DNSKEY \(ERROR\)](#)

▼ 7.39.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.39.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.39.6. Test suites

This test case is used in the following test suite(s):

- [DNS Security Extensions \(DNSSEC\)](#)
-

7.40. dnssec-06 - Verify DNSSEC additional processing

7.40.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.40.2. Description

This test case comes from version v2023.1.4 of Zonemaster. For more information, please refer to [the documentation for this test case](#).

Objective

In order for an authoritative name server to be DNSSEC compliant, it must serve DNSSEC signatures (RRSIG) as additional data in a DNS answer. This additional processing is described in section 3.1 of [RFC 4035](#).

▼ 7.40.3. Errors

This test case may produce the following errors:

- [DNS_INCONSISTENT_RESPONSES \(ERROR\)](#)
- [ZM_EXTRA_PROCESSING_BROKEN \(ERROR\)](#)

▼ 7.40.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.40.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.40.6. Test suites

This test case is used in the following test suite(s):

- [DNS Security Extensions \(DNSSEC\)](#)
-

7.41. dnssec-08 - Valid RRSIG for DNSKEY

7.41.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.41.2. Description

This test case comes from version v2023.1.4 of Zonemaster. For more information, please refer to [the documentation for this test case](#).

Objective

A DNSSEC signed zone should have a DNSKEY RRset in the zone apex ([RFC 4035](#), section 2.1) and that RRset should be signed by a key that matches one of the records in the DNSKEY RRset ([RFC 4035](#), section 2.2).

This test case will verify if the *Child Zone* meets that requirement.

▼ 7.41.3. Errors

This test case may produce the following errors:

- [DNS_INCONSISTENT_RESPONSES \(ERROR\)](#)
- [ZM_DS08_DNSKEY_RRSIG_EXPIRED \(ERROR\)](#)
- [ZM_DS08_DNSKEY_RRSIG_NOT_YET_VALID \(ERROR\)](#)
- [ZM_DS08_MISSING_RRSIG_IN_RESPONSE \(ERROR\)](#)
- [ZM_DS08_NO_MATCHING_DNSKEY \(ERROR\)](#)
- [ZM_DS08_RRSIG_NOT_VALID_BY_DNSKEY \(ERROR\)](#)

▼ 7.41.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.41.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.41.6. Test suites

This test case is used in the following test suite(s):

- [DNS Security Extensions \(DNSSEC\)](#)
-

7.42. dnssec-09 - RRSIG(SOA) must be valid and created by a valid DNSKEY

7.42.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.42.2. Description

This test case comes from version v2023.1.4 of Zonemaster. For more information, please refer to [the documentation for this test case](#).

Objective

If the zone is signed, the SOA RR should be signed with a valid RRSIG using a DNSKEY from the DNSKEY RR set. This is described in [RFC 4035](#), section 2.2.

This test case will verify if the *Child Zone* meets that requirement.

▼ 7.42.3. Errors

This test case may produce the following errors:

- [DNS_INCONSISTENT_RESPONSES \(ERROR\)](#)
- [ZM_DS09_MISSING_RRSIG_IN_RESPONSE \(ERROR\)](#)
- [ZM_DS09_NO_MATCHING_DNSKEY \(ERROR\)](#)
- [ZM_DS09_RRSIG_NOT_VALID_BY_DNSKEY \(ERROR\)](#)
- [ZM_DS09_SOASIG_EXPIRED \(ERROR\)](#)
- [ZM_DS09_SOASIG_NOT_YET_VALID \(ERROR\)](#)

▼ 7.42.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.42.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.42.6. Test suites

This test case is used in the following test suite(s):

- [DNS Security Extensions \(DNSSEC\)](#)
-

7.43. dnssec-10 - Zone contains NSEC or NSEC3 records

7.43.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.43.2. Description

This test case comes from version v2023.1.4 of Zonemaster. For more information, please refer to [the documentation for this test case](#).

Objective

When DNSSEC is enabled, NSEC or NSEC3 records provide a secure denial of existence for records not present in the zone. This test case verifies that correct NSEC or NSEC3 records with valid signatures are returned for a query for an non-existent name.

Furthermore, it is verified that the name servers for the zone are consistent about NSEC and NSEC3, i.e. either all servers should use NSEC or all servers should use NSEC3. It is never permitted to serve both NSEC and NSEC3 for the same zone.

The use of the NSEC RR type is described in [RFC 4035](#), section 3.1.3, and the description of the NSEC RR itself is in [RFC 4034](#), section 4.

The description of the NSEC3 RR is in [RFC 5155](#), section 3, and its use in the DNS response is described in [RFC 5155](#), section 7.2.

▼ 7.43.3. Errors

This test case may produce the following errors:

- [DNS_INCONSISTENT_RESPONSES\(ERROR\)](#)
- [ZM_DS10_INCONSISTENT_NSEC_NSEC3\(ERROR\)](#)
- [ZM_DS10_MISSING_NSEC_NSEC3\(ERROR\)](#)
- [ZM_DS10_MIXED_NSEC_NSEC3\(ERROR\)](#)
- [ZM_DS10_NAME_NOT_COVERED_BY_NSEC\(ERROR\)](#)
- [ZM_DS10_NAME_NOT_COVERED_BY_NSEC3\(ERROR\)](#)
- [ZM_DS10_NON_EXISTENT_RESPONSE_ERROR\(ERROR\)](#)
- [ZM_DS10_NSEC3_MISSING_SIGNATURE\(ERROR\)](#)
- [ZM_DS10_NSEC3_RRSIG_VERIFY_ERROR\(ERROR\)](#)
- [ZM_DS10_NSEC_MISSING_SIGNATURE\(ERROR\)](#)
- [ZM_DS10_NSEC_RRSIG_VERIFY_ERROR\(ERROR\)](#)
- [ZM_DS10_UNSIGNED_ANSWER\(ERROR\)](#)

▼ 7.43.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.43.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.43.6. Test suites

This test case is used in the following test suite(s):

- [DNS Security Extensions \(DNSSEC\)](#)

7.44. dnssec-13 - All DNSKEY algorithms used to sign the zone

7.44.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.44.2. Description

Note: the severity levels of one or more error codes for this test case have been changed from the default.

This test case comes from version v2023.1.4 of Zonemaster. For more information, please refer to [the documentation for this test case](#).

Objective

From [RFC 6840](#), section 5.11:

The DS RRset and DNSKEY RRset are used to signal which algorithms are used to sign a zone. [...] The zone MUST also be signed with each algorithm (though not each key) present in the DNSKEY RRset. [...]

To verify that the whole zone is signed with all algorithms require access to the complete zone, which is generally not possible for public zones. This test case is limited to three RRsets that must be present in a signed zone, the SOA RRset, the NS RRset and the DNSKEY RRset.

This test case will verify that for each DNSKEY algorithm, there is a RRSIG of that algorithm for the three selected RRsets.

▼ 7.44.3. Errors

This test case may produce the following errors:

- [DNS_INCONSISTENT_RESPONSES \(ERROR\)](#)
- [ZM_DS13_ALGO_NOT_SIGNED_DNSKEY \(ERROR\)](#)
- [ZM_DS13_ALGO_NOT_SIGNED_NS \(ERROR\)](#)
- [ZM_DS13_ALGO_NOT_SIGNED_SOA \(ERROR\)](#)

▼ 7.44.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.44.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.44.6. Test suites

This test case is used in the following test suite(s):

- [DNS Security Extensions \(DNSSEC\)](#)

7.45. dnssec-14 - Check for valid RSA DNSKEY key size

7.45.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.45.2. Description

Note: the severity levels of one or more error codes for this test case have been changed from the default.

This test case comes from version v2023.1.4 of Zonemaster. For more information, please refer to [the documentation for this test case](#).

Objective

The DNSKEYs based on RSA have different minimum and maximum key sizes, which must be followed. This test case will validate the keys size of such keys. RSA based algorithms that are deprecated or else not suitable for DNSKEY ([RFC 8624](#) and [IANA registry](#)) are just ignored. See test case [DNSSEC05](#) for test of algorithm.

The table 1 below specify the maximum and minimum key size, respectively. Algorithm number can be found in [IANA registry](#).

Table 1: Minimum and maximum RSA key sizes in bits

Algorithm	Min size	Max size	Reference
5	512	4096	RFC 3110
7	512	4096	RFC 5155
8	512	4096	RFC 5702
10	1024	4096	RFC 5702

It is also recommended that an RSA based algorithm has a key length of at least 2048 bit as stated in [NIST SP 800-57 Part 1 Rev. 4](#), table 2 on page 53 in section 5.6.1 and table 4 on page 55 in section 5.6.2.

This test case verifies that RSA DNSKEYs follows the stated key lengths from the RFCs and also the NIST recommended shortest key length.

▼ 7.45.3. Errors

This test case may produce the following errors:

- [DNS_INCONSISTENT_RESPONSES \(ERROR\)](#)
- [ZM_DNSKEY_SMALLER_THAN_REC \(WARNING\)](#)
- [ZM_DNSKEY_TOO_LARGE_FOR_ALGO \(ERROR\)](#)
- [ZM_DNSKEY_TOO_SMALL_FOR_ALGO \(ERROR\)](#)
- [ZM_NO_RESPONSE \(ERROR\)](#)
- [ZM_NO_RESPONSE_DNSKEY \(ERROR\)](#)

▼ 7.45.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.45.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.45.6. Test suites

This test case is used in the following test suite(s):

- [DNS Security Extensions \(DNSSEC\)](#)

7.46. dnssec-91 - Permitted signing algorithms

7.46.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.46.2. Description

In addition to the requirements outlined in dnssec-05, this test imposes an additional requirement on the signing algorithms used to sign zones.

Specifically, the algorithm number **MUST NOT** be lower than 8.

▼ 7.46.3. Errors

This test case may produce the following errors:

- [DNSSEC_DNS_QUERY_ERROR\(ERROR\)](#)
- [DNSSEC_INVALID_SIGNING_ALGORITHM\(ERROR\)](#)

▼ 7.46.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.46.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

This test case is used in the following test suite(s):

- [DNS Security Extensions \(DNSSEC\)](#)
-

7.47. dnssec-92 - Permitted DS record hash algorithm(s)

7.47.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.47.2. Description

The DS record(s) submitted in the dnssec.dsRecords input parameter will be validated. Algorithm 1 (SHA-1) **MUST NOT** be used.

▼ 7.47.3. Errors

This test case may produce the following errors:

- [DNSSEC_DNS_QUERY_ERROR \(ERROR\)](#)
- [DNSSEC_INVALID_DIGEST_ALGORITHM \(ERROR\)](#)

▼ 7.47.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.47.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.47.6. Test suites

This test case is used in the following test suite(s):

- [DNS Security Extensions \(DNSSEC\)](#)
-

7.48. dnssec-93 - NSEC3 iterations check

7.48.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.48.2. Description

RFC 9276 defines best practice relating to the use of NSEC3 for Authenticated Denial of Existence. This test case verifies that the zone's NSEC3 configuration complies with this best practice.

If the zone does not use NSEC3, then this test will be skipped.

The NSEC3PARAM record will be checked to ensure that:

- the value of the `iterations` field of the NSEC3 record is zero;
- the value of the `salt` field of the NSEC3 record is empty (represented as a – in the presentation format).

▼ 7.48.3. Errors

This test case may produce the following errors:

- [DNSSEC DNS QUERY ERROR \(ERROR\)](#)
- [DNSSEC_NSEC3_ITERATIONS_IS_NOT_ZERO \(ERROR\)](#)
- [DNSSEC_NSEC3_SALT_IS_NOT_EMPTY \(ERROR\)](#)

▼ 7.48.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.48.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.48.6. Test suites

This test case is used in the following test suite(s):

- [DNS Security Extensions \(DNSSEC\)](#)
-

7.49. dnssecOps01-ZSKRollover - ZSK rollover

7.49.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.49.2. Description

This test case verifies the RSP's ability to perform a ZSK rollover (as described in [Section 4.1.1 of RFC 6781](#)).

If the value of the `dnssecOps.csk` input parameter is `true`, then this test will be skipped.

The system will monitor the zone specified in the `dnssec.zskRolloverZone` input parameter. The domain may be present anywhere in the global DNS hierarchy (that is, it does not need to be a TLD), but **MUST** have a secure chain of trust up to the root zone, so that it can be validated using the root zone trust anchor.

The zone **MUST** contain at least 10,000 delegations, where a delegation is considered to be one or more NS records with owner names that are below the zone's origin. If NSEC3 is used for secure denial of existence, the opt-out flag **MUST NOT** be set (*that is, an RRSIG record should be present for all NS rrsets, irrespective of whether a corresponding DS record is published*).

Monitoring will be carried out using SOA queries sent to multiple validating DNS resolvers, and by validating the result of a zone transfer from the server(s) specified in the `dnssecOps.primaryServers` input parameter.

During the test period (currently defined as 48 hours) the operator **MUST** successfully carry out a ZSK rollover for the domain, where the Zone Signing Key is replaced, without disrupting the chain of trust.

The original ZSK **MUST** additionally be unpublished (removed from the zone) before the end of the test period.

To simplify testing, applicants may wish to provision the zone such that it is configured with short TTLs and a short ZSK lifetime, so that a ZSK rollover is guaranteed to occur within the 48 test period.

▼ 7.49.3. Errors

This test case may produce the following errors:

- [DNSSEC OPS DNS QUERY FAILED TOO MANY TIMES \(ERROR\)](#)
- [DNSSEC OPS XFR FAILED TOO MANY TIMES \(ERROR\)](#)
- [DNSSEC OPS ZONE IS INVALID \(CRITICAL\)](#)
- [DNSSEC OPS ZSK ROLLOVER CHAIN OF TRUST BROKEN \(ERROR\)](#)
- [DNSSEC OPS ZSK ROLLOVER NOT COMPLETED \(ERROR\)](#)

▼ 7.49.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- [dnssecOps.csk \(input\)](#)
- [dnssecOps.zskRolloverZone \(input\)](#)

▼ 7.49.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.49.6. Test suites

This test case is used in the following test suite(s):

- [DNSSEC Operations](#)

7.50. dnssecOps02-KSKRollover - KSK rollover

7.50.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.50.2. Description

This test case verifies the RSP's ability to perform a CSK/KSK rollover (as described in [Sections 4.1.2 and 4.13 of RFC 6781](#)).

The system will monitor the zone specified in the `dnssec.kskRolloverZone` input parameter. The domain may be present anywhere in the global DNS hierarchy (that is, it does not need to be a TLD), but **MUST** have a secure chain of trust up to the root zone, so that it can be validated using the root zone trust anchor.

The zone **MUST** contain at least 10,000 delegations, where a delegation is considered to be one or more NS records with owner names that are below the zone's origin. If NSEC3 is used for secure denial of existence, the opt-out flag **MUST NOT** be set (*that is, an RR SIG record should be present for all NS rrsets, irrespective of whether a corresponding DS record is published*).

Monitoring will be carried out using SOA queries sent to multiple validating DNS resolvers, and by validating the result of a zone transfer from the server(s) specified in the `dnssecOps.primaryServers` input parameter.

During the test period (currently defined as 48 hours) the operator **MUST** successfully carry out a KSK rollover for the domain, where the Key Signing Key is replaced, and the DS record in the parent zone is updated, without disrupting the chain of trust.

The DS record for the original KSK **MUST** additionally be removed from the parent zone before the end of the test period.

To simplify testing, applicants may wish to use a subdomain of an existing DNSSEC-signed zone under their control, so that completion of the test is not dependent on interaction with a third party.

▼ 7.50.3. Errors

This test case may produce the following errors:

- [DNSSEC_OPS_DNS_QUERY_FAILED_TOO_MANY_TIMES \(ERROR\)](#)
- [DNSSEC_OPS_KSK_ROLLOVER_CHAIN_OF_TRUST_BROKEN \(ERROR\)](#)
- [DNSSEC_OPS_KSK_ROLLOVER_NOT_COMPLETED \(ERROR\)](#)
- [DNSSEC_OPS_XFR_FAILED_TOO_MANY_TIMES \(ERROR\)](#)
- [DNSSEC_OPS_ZONE_IS_INVALID \(CRITICAL\)](#)

▼ 7.50.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- [dnssecOps.kskRolloverZone \(input\)](#)

▼ 7.50.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.50.6. Test suites

This test case is used in the following test suite(s):

- [DNSSEC Operations](#)

7.51. dnssecOps03-AlgorithmRollover - algorithm rollover

7.51.1. Maturity Level

- **GAMMA**: finalized and ready for review

7.51.2. Description

This test case verifies the RSP's ability to perform an algorithm rollover (as described in [Section 4.1.4 of RFC 6781](#)).

The system will monitor the zone specified in the `dnssec.algorithmRolloverZone` input parameter. The domain may be present anywhere in the global DNS hierarchy (that is, it does not need to be a TLD), but **MUST** have a secure chain of trust up to the root zone, so that it can be validated using the root zone trust anchor.

The zone **MUST** contain at least 10,000 delegations, where a delegation is considered to be one or more NS records with owner names that are below the zone's origin. If NSEC3 is used for secure denial of existence, the opt-out flag **MUST NOT** be set (*that is, an RRSIG record should be present for all NS rrsets, irrespective of whether a corresponding DS record is published*).

Monitoring will be carried out using SOA queries sent to multiple validating DNS resolvers, and by validating the result of a zone transfer from the server(s) specified in the `dnssecOps.primaryServesR` input parameter.

During the test period (currently defined as 48 hours) the operator **MUST** successfully carry out an algorithm rollover for the domain (including an update to the DS record in the parent zone), where the algorithm used to secure the domain is changed, without disrupting the chain of trust.

The DS record for the original KSK **MUST** additionally be removed from the parent zone before the end of the test period.

Note that the specific algorithms being rolled to and from are not significant (although they **MUST** be present in the IANA registry and comply with all other requirements specified in the DNSSEC test suite); it is not required that the new algorithm be more "secure" than the original algorithm; only that they are different. So for example, a rollover from algorithm 13 (ECDSAP256SHA256) to algorithm 8 (RSASHA256) will be accepted as well as a rollover from RSASHA256 to ECDSAP256SHA256.

To simplify testing, applicants may wish to use a subdomain of an existing DNSSEC-signed zone under their control, so that completion of the test is not dependent on interaction with a third party.

▼ 7.51.3. Errors

This test case may produce the following errors:

- [DNSSEC_OPS_ALGORITHM_ROLLOVER_CHAIN_OF_TRUST_BROKEN \(ERROR\)](#)
- [DNSSEC_OPS_ALGORITHM_ROLLOVER_NOT_COMPLETED \(ERROR\)](#)
- [DNSSEC_OPS_DNS_QUERY_FAILED_TOO_MANY_TIMES \(ERROR\)](#)
- [DNSSEC_OPS_INVALID_ALGORITHM \(ERROR\)](#)
- [DNSSEC_OPS_XFR_FAILED_TOO_MANY_TIMES \(ERROR\)](#)
- [DNSSEC_OPS_ZONE_IS_INVALID \(CRITICAL\)](#)

▼ 7.51.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- [dnssecOps.algorithmRolloverZone \(input\)](#)

▼ 7.51.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.51.6. Test suites

This test case is used in the following test suite(s):

- [DNSSEC Operations](#)

7.52. epp-01 - Service connectivity test

7.52.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.52.2. Description

This test confirms that the EPP service is reachable from the probe servers.

1. At least one A record **MUST** be published in the DNS for the EPP hostname, to allow IPv4-only hosts to connect to the EPP service.
2. At least one AAAA record **SHOULD** be published in the DNS for the EPP hostname, to allow IPv6-only hosts to connect to the EPP service.
3. EPP is associated with TCP port 700. All IPv4/IPv6 addresses published in the DNS for the EPP hostname **MUST** accept TCP connections on this port. Since the EPP specification requires IP-based access control, the RSP **MUST** configure their firewall to allow access from the IP addresses listed in the `epp.clientACL` resource.
4. EPP uses TLS to secure the channel between client and server. All service ports **MUST** support TLSv1.2 and optionally any subsequent protocol published by the IETF.
5. TLSv1.1 and all previous versions have known security issues and **MUST NOT** be supported by any service ports.
6. To ensure that the connection can be trusted, all service ports **MUST** present a certificate issued by a trusted CA, such as those supported by major browsers.
7. All TLS certificates **MUST NOT** have expired, and **MUST** be presented with any required intermediate certificates.
8. The EPP server name **MUST** match at least one `subjectAltName` field in all presented certificates (either exact match or wildcard).
9. Service ports **MUST** use at least one of the ciphers recommended in RFC 9325 (or any successor document).

▼ 7.52.3. Errors

This test case may produce the following errors:

- [EPP_DNS_RESOLUTION_ERROR \(CRITICAL\)](#)
- [EPP_MISSING_AAAA_RECORDS \(WARNING\)](#)
- [EPP_MISSING_A_RECORDS \(CRITICAL\)](#)
- [EPP_NO_SERVICE_PORTS_REACHABLE \(CRITICAL\)](#)
- [EPP_SERVICE_PORT_UNREACHABLE \(WARNING\)](#)
- [EPP_TLS_BAD_CIPHER \(ERROR\)](#)
- [EPP_TLS_CERTIFICATE_CHAIN_MISSING \(ERROR\)](#)
- [EPP_TLS_CERTIFICATE_HOSTNAME_MISMATCH \(ERROR\)](#)
- [EPP_TLS_CONNECTION_ERROR \(ERROR\)](#)
- [EPP_TLS_EXPIRED_CERTIFICATE \(ERROR\)](#)
- [EPP_TLS_FORBIDDEN_PROTOCOL_SUPPORTED \(ERROR\)](#)
- [EPP_TLS_REQUIRED_PROTOCOL_NOT_SUPPORTED \(ERROR\)](#)
- [EPP_TLS_UNTRUSTED_CERTIFICATE \(ERROR\)](#)

▼ 7.52.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.52.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- [epp.tlsCertificateStore](#)

▼ 7.52.6. Test suites

This test case is used in the following test suite(s):

- [Extensible Provisioning Protocol \(EPP\)](#)

7.53. epp-02 - Protocol conformance test

7.53.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.53.2. Description

Once a connection is established, all service ports **MUST** send a valid <greeting> frame to the client.

1. The <svID> element in the <greeting> **MUST** identify the EPP server.
2. The <svDate> element in the <greeting> **MUST** specify a time within 30 seconds of the current date and time as received from the NTP network.
3. There **MUST** be exactly one <version> element in the and it **MUST** contain exactly 1.0.
4. All <lang> element(s) in the <greeting> **MUST** contain valid language codes. At least en **MUST** be included.
5. All <objURI> element(s) in the <greeting> **MUST** contain XML namespace URIs that are appropriate. The only mandatory URI that **MUST** be present is the domain namespace URI. The host and contact namespace URIs may be required depending on the `epp.hostModel` and `general.registryDataModel` parameters.
6. All <extURI> element(s) in the <greeting> **MUST** contain XML namespace URIs that have been registered in the IANA registry, and that the mandatory extensions are also included.
7. <extURI> elements containing the following XML namespaces **MUST** be present in the <greeting>:
 - urn:ietf:params:xml:ns:secDNS-1.1
 - urn:ietf:params:xml:ns:launch-1.0
 - urn:ietf:params:xml:ns:rgp-1.0
8. With the exception of the <svDate> element, all values in the <greeting> **MUST** match those found in the `epp.greeting` input parameter.

This test case will produce the `EPP_GREETING_RECOMMENDED_EXTENSION_MISSING` warning if any of the following XML namespace URIs are not included in the <svcExtension> element:

- urn:ietf:params:xml:ns:epp:secure-authinfo-transfer-1.0
- urn:ietf:params:xml:ns:epp:unhandled-namespaces-1.0
- urn:ietf:params:xml:schema:epp:loginSec-1.0

▼ 7.53.3. Errors

This test case may produce the following errors:

- [EPP_DNS_RESOLUTION_ERROR\(CRITICAL\)](#)
- [EPP_GREETING_DOES_NOT_MATCH\(ERROR\)](#)
- [EPP_GREETING_INVALID_LANG\(ERROR\)](#)
- [EPP_GREETING_MISSING_EN_LANG\(ERROR\)](#)
- [EPP_GREETING_MISSING_EXTURI\(ERROR\)](#)
- [EPP_GREETING_MISSING_OBJURI\(ERROR\)](#)
- [EPP_GREETING_RECOMMENDED_EXTENSION_MISSING\(WARNING\)](#)
- [EPP_GREETING_SVDATE_INVALID\(ERROR\)](#)
- [EPP_GREETING_SVID_INVALID\(ERROR\)](#)
- [EPP_GREETING_UNEXPECTED_EXTURI\(ERROR\)](#)
- [EPP_GREETING_UNEXPECTED_OBJURI\(ERROR\)](#)
- [EPP_GREETING_VERSION_INVALID\(ERROR\)](#)
- [EPP_NO_GREETING_RECEIVED\(ERROR\)](#)
- [EPP_NO_SERVICE_PORTS_REACHABLE\(CRITICAL\)](#)
- [EPP_SCHEMA_VALIDATION_ERROR\(ERROR\)](#)

- [EPP_SERVICE_PORT_UNREACHABLE \(WARNING\)](#)
- [EPP_TLS_CONNECTION_ERROR \(ERROR\)](#)
- [EPP_XML_PARSE_ERROR \(ERROR\)](#)

▼ 7.53.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- [epp.greeting \(file\)](#)

▼ 7.53.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.53.6. Test suites

This test case is used in the following test suite(s):

- [Extensible Provisioning Protocol \(EPP\)](#)
-

7.54. epp-03 - Authentication test

7.54.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.54.2. Description

This test case validates the server's implementation of client authentication. The client will submit a series of <login> commands to confirm that:

- the server rejects a <login> command with a (randomly generated) non-existent client ID;
- the server rejects a <login> command with a valid client ID, but an invalid password;
- the server rejects a <login> command with a valid client ID and password but an incorrect client certificate;
- the server accepts a <login> command with a valid client ID, password and client certificate;

The client will use the object and extension XML namespaces from the server's <greeting> as part of the <login> command.

If the server supports the Login Security Extension (see RFC 8807) then this will be used by the client.

▼ 7.54.3. Errors

This test case may produce the following errors:

- [EPP_DNS_RESOLUTION_ERROR \(CRITICAL\)](#)
- [EPP_LOGIN_UNEXPECTEDLY_FAILED \(ERROR\)](#)
- [EPP_LOGIN_UNEXPECTEDLY_SUCCEEDED \(ERROR\)](#)
- [EPP_NO_SERVICE_PORTS_REACHABLE \(CRITICAL\)](#)
- [EPP_SCHEMA_VALIDATION_ERROR \(ERROR\)](#)
- [EPP_SERVICE_PORT_UNREACHABLE \(WARNING\)](#)
- [EPP_TLS_CONNECTION_ERROR \(ERROR\)](#)
- [EPP_XML_PARSE_ERROR \(ERROR\)](#)

▼ 7.54.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.54.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

This test case is used in the following test suite(s):

- [Extensible Provisioning Protocol \(EPP\)](#)
-

7.55. epp-04 - Domain <check> command test

7.55.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.55.2. Description

The client will perform a series of <check> commands and will validate the avail attribute of the <domain:name> elements in the server response, as follows:

- syntactically invalid domain name: avail attribute **MUST** be 0 or false.
- valid but registered domain name: avail attribute **MUST** be 0 or false.
- syntactically valid, unregistered domain name: avail attribute **MUST** be 1 or true. The domain name will be generated using random characters.

A “syntactically valid” domain name is one that complies with the format specified in RFC 1123 (this test case does not consider IDN names).

These checks will be carried out for each TLD in the TLD set.

▼ 7.55.3. Errors

This test case may produce the following errors:

- [EPP_DNS_RESOLUTION_ERROR \(CRITICAL\)](#)
- [EPP_DOMAIN_CHECK_INVALID_DOMAIN_INCORRECT_AVAIL \(ERROR\)](#)
- [EPP_DOMAIN_CHECK_REGISTERED_DOMAIN_INCORRECT_AVAIL \(ERROR\)](#)
- [EPP_DOMAIN_CHECK_VALID_DOMAIN_INCORRECT_AVAIL \(ERROR\)](#)
- [EPP_LOGIN_ERROR \(CRITICAL\)](#)
- [EPP_NO_SERVICE_PORTS_REACHABLE \(CRITICAL\)](#)
- [EPP_SCHEMA_VALIDATION_ERROR \(ERROR\)](#)
- [EPP_SERVICE_PORT_UNREACHABLE \(WARNING\)](#)
- [EPP_TLS_CONNECTION_ERROR \(ERROR\)](#)
- [EPP_XML_PARSE_ERROR \(ERROR\)](#)

- *None specified.*

▼ 7.55.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.55.6. Test suites

This test case is used in the following test suite(s):

- [Extensible Provisioning Protocol \(EPP\)](#)

7.56. epp-05 - Host <check> command test (if applicable)

7.56.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.56.2. Description

If the EPP server supports host objects, this test will perform a series of <check> commands and will validate the avail attribute of the <host: name> elements in the server response, as follows:

- syntactically invalid hostname: avail attribute **MUST** be 0 or false.
- valid but registered hostname: avail attribute **MUST** be 0 or false.
- syntactically valid and unregistered hostname: avail attribute **MUST** be 1 or true. The hostname will be generated using random characters.

A “syntactically valid” hostname is one that complies with the format specified in RFC 1123 (this test case does not consider IDN names).

▼ 7.56.3. Errors

This test case may produce the following errors:

- [EPP_DNS_RESOLUTION_ERROR \(CRITICAL\)](#)
- [EPP_HOST_CHECK_INVALID_HOST_INCORRECT_AVAIL \(ERROR\)](#)
- [EPP_HOST_CHECK_REGISTERED_HOST_INCORRECT_AVAIL \(ERROR\)](#)

- [EPP_SERVICE_PORT_UNREACHABLE\(WARNING\)](#)
- [EPP_TLS_CONNECTION_ERROR\(ERROR\)](#)
- [EPP_XML_PARSE_ERROR\(ERROR\)](#)

▼ 7.57.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- [epp.registeredContacts\(input\)](#)

▼ 7.57.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.57.6. Test suites

This test case is used in the following test suite(s):

- [Extensible Provisioning Protocol \(EPP\)](#)

7.58. epp-07 - Contact <create> command test (if applicable for the registry type)

7.58.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.58.2. Description

This test attempts to create a number of contact objects, and validates the server's response. For example, the test will expect that the server will reject a command that creates an object with missing or invalid properties, but will accept a command to create an object with valid properties. Property values will be randomly generated but will contain realistic values. No personal

information will be transmitted as part of this test.

If the general `.registryDataModel` input parameter is `minimum`, this test will be skipped. Otherwise, this client will select the appropriate registrar credentials based on the values of the `epp.clid01DataModel` and `epp.clid02DataModel` input parameters.

The test will confirm that the server checks and validates the values of the following elements against the XML schema provided in RFC 5733:

- `<contact:id>`
- `<contact:postalInfo>` element(s)
- `<contact:name>` element
- `<contact:org>` element
- `<contact:street>` element
- `<contact:city>` element
- `<contact:cc>` element
- `<contact:voice>`
- `<contact:email>`
- The server **MUST NOT** accept a `<contact:id>` element that contains a value that is not a valid `clIDType` value;
- The server **MUST NOT** accept a `<contact:postalInfo>` element that contains a `type` attribute that is neither `int` nor `loc`;
- The server **MUST NOT** accept a `<contact:cc>` element that contains a value that is not a valid ISO 3166-1 alpha-2 code;
- The server **MUST NOT** accept a `<contact:voice>` element that contains a value that does not conform to the format described in Section 2.5 of RFC 5733;
- The server **MUST NOT** accept a `<contact:email>` element that contains a value that does not conform to the format specified in RFC 5322.

Once objects have been created, the client will then perform `<info>` commands to verify that the server has correctly stored the provided values.

▼ 7.58.3. Errors

This test case may produce the following errors:

- [EPP_CONTACT_CREATE_INFO_RESPONSE_MISSING_OR_INCORRECT_CC \(ERROR\)](#)
- [EPP_CONTACT_CREATE_INFO_RESPONSE_MISSING_OR_INCORRECT_CITY \(ERROR\)](#)

- [Extensible Provisioning Protocol \(EPP\)](#)
-

7.59. epp-08 - Contact object access control (if applicable)

7.59.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.59.2. Description

This test will confirm that EPP clients are unable to perform <info> commands on objects that they do not sponsor.

If the general.registryDataModel input parameter is minimum, this test will be skipped.

The client will connect using a set of alternate credentials and will submit <info> and <update> commands on the contact objects created in epp-08. The server **MUST** respond with a 2201 “authorization error” response.

▼ 7.59.3. Errors

This test case may produce the following errors:

- [EPP_CONTACT_INFO_RESPONSE_NOT_2201\(ERROR\)](#)
- [EPP_CONTACT_UPDATE_RESPONSE_NOT_2201\(ERROR\)](#)
- [EPP_DNS_RESOLUTION_ERROR\(CRITICAL\)](#)
- [EPP_LOGIN_ERROR\(CRITICAL\)](#)
- [EPP_NO_SERVICE_PORTS_REACHABLE\(CRITICAL\)](#)

▼ 7.59.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.59.6. Test suites

This test case is used in the following test suite(s):

- [Extensible Provisioning Protocol \(EPP\)](#)

7.60. epp-09 - Contact <update> command test (if applicable for the registry type)

7.60.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.60.2. Description

This test will perform <update> commands on the objects created during epp-07 and will confirm that the server correctly rejects invalid commands (which would specify invalid property values) and accepts valid commands.

If the general.registryDataModel input parameter is minimum, this test will be skipped. Otherwise, this client will select the appropriate registrar credentials based on the values of the epp.clid01DataModel and epp.clid02DataModel input

parameters.

The test will confirm that the server checks and validates <update> commands which transform the values of the following elements:

- <contact:status>
- <contact:postalInfo> elements (both int and loc)
 - <contact:name>
 - <contact:org>
 - <contact:addr> elements
 - <contact:street> element(s)
 - <contact:city> element
 - <contact:sp> element
 - <contact:pc> element
 - <contact:cc> element
- <contact:voice>
- <contact:email>

Once objects have been updated, the client will then perform <info> commands to verify that the server has correctly stored the provided values.

▼ 7.60.3. Errors

This test case may produce the following errors:

- [EPP_CONTACT_UPDATE_INFO_RESPONSE_MISSING_OR_INCORRECT_CC\(ERROR\)](#)
- [EPP_CONTACT_UPDATE_INFO_RESPONSE_MISSING_OR_INCORRECT_CITY\(ERROR\)](#)
- [EPP_CONTACT_UPDATE_INFO_RESPONSE_MISSING_OR_INCORRECT_EMAIL\(ERROR\)](#)
- [EPP_CONTACT_UPDATE_INFO_RESPONSE_MISSING_OR_INCORRECT_ID\(ERROR\)](#)

▼ 7.60.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.60.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.60.6. Test suites

This test case is used in the following test suite(s):

- [Extensible Provisioning Protocol \(EPP\)](#)
-

7.61. epp-10 - Contact <delete> command test (if applicable for the registry type)

7.61.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.61.2. Description

This test will perform <delete> commands on the objects created during epp-24 and will confirm that the server accepts the <delete> command with a 1xxx response code.

If the general.registryDataModel input parameter is minimum, this test will be skipped.

Once the <delete> commands have been submitted, the client will perform <info> commands to confirm that the objects have actually been removed from the repository. If the response to the previous <delete> command was 1001, this step will be skipped.

▼ 7.61.3. Errors

This test case may produce the following errors:

- [EPP_CONTACT_DELETE_OBJECT_STILL_EXISTS \(ERROR\)](#)
- [EPP_CONTACT_DELETE_RESPONSE_NOT_1000_OR_1001 \(ERROR\)](#)
- [EPP_DNS_RESOLUTION_ERROR \(CRITICAL\)](#)
- [EPP_LOGIN_ERROR \(CRITICAL\)](#)
- [EPP_NO_SERVICE_PORTS_REACHABLE \(CRITICAL\)](#)
- [EPP_SCHEMA_VALIDATION_ERROR \(ERROR\)](#)
- [EPP_SERVICE_PORT_UNREACHABLE \(WARNING\)](#)
- [EPP_TLS_CONNECTION_ERROR \(ERROR\)](#)
- [EPP_XML_PARSE_ERROR \(ERROR\)](#)

▼ 7.61.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.61.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.61.6. Test suites

This test case is used in the following test suite(s):

- [Extensible Provisioning Protocol \(EPP\)](#)
-

7.62. epp-11 - Host <create> command test (if applicable)

7.62.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.62.2. Description

This test attempts to create a number of host objects, and validates the server's response. For example, the test will expect that the server will reject a command that creates an object with missing or invalid properties, but will accept a command to create an object with valid properties. Property values will be randomly generated but will contain realistic values. No personal information will be transmitted as part of this test.

If the `epp.hostModel` input parameter is `attributes`, this test will be skipped.

The test will confirm that the server checks and validates the values of the following elements:

- `<host:name>` (both in- and out-of-bailiwick, for each TLD in the TLD set)
- `<host:status>`
- `<host:addr>` elements (both IPv4 and IPv6)

If the `epp.hostModel` input parameter is `attributes`, this test will be skipped.

The client will then perform `<info>` commands on the objects successfully created to confirm that the server has correctly stored the provided values.

▼ 7.62.3. Errors

This test case may produce the following errors:

- [EPP_DNS_RESOLUTION_ERROR \(CRITICAL\)](#)
- [EPP_HOST_CREATE_INFO_RESPONSE_MISSING_OBJECT_PROPERTIES \(ERROR\)](#)
- [EPP_HOST_CREATE_INFO_RESPONSE_OBJECT_DOES_NOT_EXIST \(ERROR\)](#)
- [EPP_HOST_CREATE_SERVER_ACCEPTS_INVALID_HOSTNAME \(ERROR\)](#)
- [EPP_HOST_CREATE_SERVER_ACCEPTS_INVALID_IPV4_ADDRESS \(ERROR\)](#)
- [EPP_HOST_CREATE_SERVER_ACCEPTS_INVALID_IPV6_ADDRESS \(ERROR\)](#)
- [EPP_LOGIN_ERROR \(CRITICAL\)](#)
- [EPP_NO_SERVICE_PORTS_REACHABLE \(CRITICAL\)](#)
- [EPP_SCHEMA_VALIDATION_ERROR \(ERROR\)](#)
- [EPP_SERVICE_PORT_UNREACHABLE \(WARNING\)](#)
- [EPP_TLS_CONNECTION_ERROR \(ERROR\)](#)
- [EPP_XML_PARSE_ERROR \(ERROR\)](#)

▼ 7.62.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.62.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.62.6. Test suites

This test case is used in the following test suite(s):

- [Extensible Provisioning Protocol \(EPP\)](#)

7.63. epp-12 - Host object access control (if applicable)

7.63.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.63.2. Description

This test will confirm that EPP clients are unable to perform <info> commands on objects that they do not sponsor.

If the `epp.hostModel` input parameter is `attributes`, this test will be skipped.

The client will connect using a set of alternate credentials and will submit <update> commands on the contact objects created in epp-11. The server **MUST** respond with a 2201 “authorization error” response.

▼ 7.63.3. Errors

This test case may produce the following errors:

- [EPP_DNS_RESOLUTION_ERROR \(CRITICAL\)](#)
- [EPP_HOST_UPDATE_AUTHZ_ERROR \(ERROR\)](#)
- [EPP_LOGIN_ERROR \(CRITICAL\)](#)
- [EPP_NO_SERVICE_PORTS_REACHABLE \(CRITICAL\)](#)
- [EPP_SCHEMA_VALIDATION_ERROR \(ERROR\)](#)
- [EPP_SERVICE_PORT_UNREACHABLE \(WARNING\)](#)
- [EPP_TLS_CONNECTION_ERROR \(ERROR\)](#)
- [EPP_XML_PARSE_ERROR \(ERROR\)](#)

▼ 7.63.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.63.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

This test case is used in the following test suite(s):

- [Extensible Provisioning Protocol \(EPP\)](#)
-

7.64. epp-13 - Host <update> command test (if applicable)

7.64.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.64.2. Description

This test will perform <update> commands on the objects created during epp-11 and will confirm that the server correctly rejects invalid commands (which would specify invalid property values) and accepts valid commands.

If the `epp.hostModel` input parameter is `attributes`, this test will be skipped.

The test will confirm that the server checks and validates <update> commands which transform the values of the following elements:

- <host:status>
- <host:addr> elements (both IPv4 and IPv6)

Note: the server's ability to support host renames is checked in a later test.

The client will then perform <info> commands on the objects successfully updated to confirm that the server has correctly stored the updated values.

▼ 7.64.3. Errors

This test case may produce the following errors:

- [EPP_DNS_RESOLUTION_ERROR \(CRITICAL\)](#)
- [EPP_HOST_UPDATE_INFO_RESPONSE_MISSING_OBJECT_PROPERTIES \(ERROR\)](#)
- [EPP_HOST_UPDATE_INFO_RESPONSE_OBJECT_DOES_NOT_EXIST \(ERROR\)](#)
- [EPP_HOST_UPDATE_SERVER_ACCEPTS_INVALID_IPV4_ADDRESS \(ERROR\)](#)
- [EPP_HOST_UPDATE_SERVER_ACCEPTS_INVALID_IPV6_ADDRESS \(ERROR\)](#)
- [EPP_HOST_UPDATE_SERVER_ACCEPTS_INVALID_STATUS_CODE \(ERROR\)](#)
- [EPP_LOGIN_ERROR \(CRITICAL\)](#)
- [EPP_NO_SERVICE_PORTS_REACHABLE \(CRITICAL\)](#)
- [EPP_SCHEMA_VALIDATION_ERROR \(ERROR\)](#)
- [EPP_SERVICE_PORT_UNREACHABLE \(WARNING\)](#)
- [EPP_TLS_CONNECTION_ERROR \(ERROR\)](#)
- [EPP_XML_PARSE_ERROR \(ERROR\)](#)

▼ 7.64.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.64.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.64.6. Test suites

This test case is used in the following test suite(s):

- [Extensible Provisioning Protocol \(EPP\)](#)

7.65. epp-14 - Domain <create> command test

7.65.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.65.2. Description

This test performs a series domain <create> commands, using pseudo-random syntactically valid ASCII domain names under each TLD in the TLD set. Depending on the value of the general.registryDataModel and `epp.requiredContactTypes` input parameters, one or more contact objects will be created (using pseudo-random contact information) beforehand and used as the registrant (and other) contacts. If the `epp.hostModel` parameter is `objects`, then two host objects with syntactically valid pseudo-random names will be created and used as the nameservers (otherwise the names will be provided as attributes).

The client will perform several <create> commands, each of which will test certain aspects of the server's processing of those commands, for example:

- to confirm that the server does not accept invalid values for object properties (such as domain name, registration period, registrant ID, nameservers, and DS record parameters). Examples:
 - invalid domain
 - invalid period (1-10 years)
 - invalid host attributes (if applicable)
 - host attributes with subordinate names and missing glue (if applicable)
 - invalid DS/keyData record parameters (keyTag, algorithm, digest type, and malformed digest)
- to confirm that the server does not accept commands which reference non-existent host/contact objects (if applicable)
- to confirm that the server rejects a <create> command which specifies a registrant contact (where the `general.registryDataModel` input parameter is `minimum` or `per-registrar`)
- to confirm that the server rejects a <create> command which does not specify a registrant contact (where the `general.registryDataModel` input parameter is `maximum` or `per-registrar`)
- to confirm that the server rejects a <create> command containing host objects when the `epp.hostModel` parameter is `attributes`
- to confirm that the server rejects a <create> command containing host attributes when the `epp.hostModel` parameter is `objects`
- to confirm that the the server which implements RFC 9154 accepts a <create> command without an authInfo command.

Both registrar IDs (those specified in the `epp.clid01` and `epp.clid02` input parameters) will be used to create domains. If the value of the `epp.registryDataModel` input parameter is `per-registrar`, then the `epp.clid01DataModel` and `epp.clid02DataModel` input parameters will be taken into consideration when determining whether contact objects are needed to successfully create a domain name.

Once the <create> commands have been processed, the client will then perform <info> commands to confirm that:

- the <roid> element is valid and contains a repository ID registered with IANA;
- the <crDate> and <exDate> elements are present and valid;
- the <crID> and <clID> elements match the client ID used to create the domain.
- DNSSEC information provided in the <create> command is present and correct.

▼ 7.65.3. Errors

This test case may produce the following errors:

- [EPP_DNS_RESOLUTION_ERROR\(CRITICAL\)](#)
- [EPP_DOMAIN_CREATE_INFO_RESPONSE_INVALID_ROID\(ERROR\)](#)
- [EPP_DOMAIN_CREATE_INFO_RESPONSE_MISSING_OBJECT_PROPERTIES\(ERROR\)](#)

This test case is used in the following test suite(s):

- [Extensible Provisioning Protocol \(EPP\)](#)
-

7.66. epp-15 - Registry object integrity test

7.66.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.66.2. Description

This test confirms that the EPP server will refuse a request to delete a linked object.

If the `epp.hostModel` input parameter is `attributes`, **and** the `general.registryDataModel` input parameter is `minimum`, then this test will be skipped. Otherwise, this client will select the appropriate registrar credentials based on the values of the `epp.clid01DataModel` and `epp.clid02DataModel` input parameters.

The client will submit `<delete>` commands for any contact and host objects created during epp-14. The server **MUST** respond with a 2305 “Object association prohibits operation” error.

▼ 7.66.3. Errors

This test case may produce the following errors:

- [EPP_DNS_RESOLUTION_ERROR \(CRITICAL\)](#)
- [EPP_INTEGRITY_SERVER_ACCEPTS_DELETE_FOR_LINKED_CONTACT_OBJECT \(ERROR\)](#)
- [EPP_INTEGRITY_SERVER_ACCEPTS_DELETE_FOR_LINKED_HOST_OBJECT \(ERROR\)](#)
- [EPP_LOGIN_ERROR \(CRITICAL\)](#)
- [EPP_NO_SERVICE_PORTS_REACHABLE \(CRITICAL\)](#)
- [EPP_SCHEMA_VALIDATION_ERROR \(ERROR\)](#)
- [EPP_SERVICE_PORT_UNREACHABLE \(WARNING\)](#)

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.66.6. Test suites

This test case is used in the following test suite(s):

- [Extensible Provisioning Protocol \(EPP\)](#)

7.67. epp-16 - Domain `<update>` command test

7.67.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.67.2. Description

This test will confirm that the client is able to perform an `<update>` command on the domain names created in epp-14, including:

- adding and removing client-assigned status codes
- adding and removing nameservers (whether objects or attributes)
- changing registrant object (if applicable)
- adding and remove DNSSEC information

The client will also confirm that it cannot perform an <update> command on a domain sponsored by another registrar, and that the server responds with a 2201 authorization error.

Once the <update> commands have been processed, the client will then perform <info> commands to confirm that the changes have been correctly stored by the server.

▼ 7.67.3. Errors

This test case may produce the following errors:

- [EPP_DNS_RESOLUTION_ERROR \(CRITICAL\)](#)
- [EPP_DOMAIN_UPDATE_INFO_RESPONSE_MISSING_DNSSEC_DATA \(ERROR\)](#)
- [EPP_DOMAIN_UPDATE_INFO_RESPONSE_MISSING_HOST_ATTRIBUTE \(ERROR\)](#)

7.68. epp-17 - Service Port consistency test

7.68.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.68.2. Description

This test confirms that all EPP service ports respond with consistent object information.

The client will establish separate connections to each EPP service port (defined as an IP address and TCP port) and perform <info> commands on the objects created in epp-14. In all cases, the server **MUST** respond with a 1000 response and the content of the <infData> element **MUST** be identical on all service ports.

▼ 7.68.3. Errors

This test case may produce the following errors:

- [EPP_DNS_RESOLUTION_ERROR \(CRITICAL\)](#)
- [EPP_LOGIN_ERROR \(CRITICAL\)](#)
- [EPP_NO_SERVICE_PORTS_REACHABLE \(CRITICAL\)](#)
- [EPP_SCHEMA_VALIDATION_ERROR \(ERROR\)](#)

- [Extensible Provisioning Protocol \(EPP\)](#)
-

7.69. epp-18 - Domain <renew> command test

7.69.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.69.2. Description

This test will confirm that the client is able to renew domain names. The client will submit a number of <renew> commands for the domains created in epp-14.

- Following a successful <renew> command, the expiry date of the domain **MUST** have been increased by the period specified by the client;
- The domain **MUST** have an RGP status of renewPeriod;
- The server **MUST** reject a <renew> command if it would result in the expiry date being more than 10 years into the future.

The client will issue the <renew> commands and then perform <info> commands to ensure that the expiry date and RGP status of the domain are set correctly.

▼ 7.69.3. Errors

This test case may produce the following errors:

- [EPP_DNS_RESOLUTION_ERROR \(CRITICAL\)](#)
- [EPP_LOGIN_ERROR \(CRITICAL\)](#)
- [EPP_NO_SERVICE_PORTS_REACHABLE \(CRITICAL\)](#)
- [EPP_RENEW_INFO_RESPONSE_MISSING_OR_INVALID_RGP_STATUS \(ERROR\)](#)
- [EPP_RENEW_INFO_RESPONSE_UNEXPECTED_EXPIRY_DATE \(ERROR\)](#)

▼ 7.69.6. Test suites

This test case is used in the following test suite(s):

- [Extensible Provisioning Protocol \(EPP\)](#)

7.70. epp-19 - Domain <transfer> command test

7.70.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.70.2. Description

This test will confirm that the client is able to initiate a domain transfer.

The client will perform an <update> command to set the authInfo code for the test domain (taken from the set created in epp-14) to a randomly-determined value. If the server implements RFC 9154, it **MUST** reject the <update> command if the authInfo code is insufficiently secure.

Then, using a second set of credentials, the client will connect to the EPP server and authenticate, submit <transfer> commands, and validate the responses.

This test will confirm that:

- the server rejects a <transfer> command with an invalid authInfo code
- the server rejects a command which would extend the domain's validity period more than 10 years into the future
- the server accepts a <transfer> command with a valid authInfo code and period.

The client will use an <info> command to ensure that the pendingTransfer status code is added to the domain after a successful transfer request.

Once the transfer request has been accepted, the sponsoring client will wait for a message to be received on the server's message queue, and will then approve the transfer. This message **MUST** be received within 120 seconds of the transfer request.

Once the gaining registrar has also received a message on the queue, the client will use an <info> command to confirm that:

- the domain is now under the sponsorship of the gaining registrar;
- the authInfo code has been reset by the server (if the server supports RFC 9154);
- the domain has the transferPeriod RGP status.

This message **MUST** be received within 120 seconds of the transfer approval.

▼ 7.70.3. Errors

This test case may produce the following errors:

- [EPP_DNS_RESOLUTION_ERROR \(CRITICAL\)](#)
- [EPP_LOGIN_ERROR \(CRITICAL\)](#)

7.71. epp-20 - Domain <transfer> rejection test

7.71.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.71.2. Description

This test confirms that the server behaves correctly if the sponsoring registrar of a domain rejects a transfer request.

The test procedure matches that of epp-19, but the transfer request will be rejected rather than approved. An <info> command will be used to confirm that the domain name remains under the sponsorship of the original registrar.

▼ 7.71.3. Errors

This test case may produce the following errors:

- [EPP_DNS_RESOLUTION_ERROR \(CRITICAL\)](#)
- [EPP_LOGIN_ERROR \(CRITICAL\)](#)
- [EPP_NO_SERVICE_PORTS_REACHABLE \(CRITICAL\)](#)
- [EPP_SCHEMA_VALIDATION_ERROR \(ERROR\)](#)
- [EPP_SERVICE_PORT_UNREACHABLE \(WARNING\)](#)
- [EPP_TLS_CONNECTION_ERROR \(ERROR\)](#)
- [EPP_TRANSFER_SERVER_PROCESSED_REJECTED_TRANSFER \(ERROR\)](#)
- [EPP_XML_PARSE_ERROR \(ERROR\)](#)

▼ 7.71.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.71.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.71.6. Test suites

This test case is used in the following test suite(s):

- [Extensible Provisioning Protocol \(EPP\)](#)
-

7.72. epp-21 - Domain <delete> command test

7.72.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.72.2. Description

This test will perform <delete> commands on the objects created during epp-14 and will confirm that the server accepts the <delete> command with a 1xxx response code.

Once the <delete> commands have been processed, the client will perform <info> commands on the deleted to object to confirm that:

- if the server responded to the <delete> command with a 1000 response, then the domain no longer exists
- if the server responded to the <delete> command with a 1001 response, then the domain has the pendingDelete status and the redemptionPeriod RGP status.

▼ 7.72.3. Errors

This test case may produce the following errors:

- [EPP_DNS_RESOLUTION_ERROR \(CRITICAL\)](#)
- [EPP_DOMAIN_DELETE_INFO_RESPONSE_OBJECT_NOT_PENDING_DELETE \(ERROR\)](#)
- [EPP_DOMAIN_DELETE_INFO_RESPONSE_OBJECT_STILL_EXISTS \(ERROR\)](#)
- [EPP_DOMAIN_DELETE_INFO_RESPONSE_RGP_STATUS_NOT_PENDING_DELETE \(ERROR\)](#)
- [EPP_LOGIN_ERROR \(CRITICAL\)](#)
- [EPP_NO_SERVICE_PORTS_REACHABLE \(CRITICAL\)](#)
- [EPP_SCHEMA_VALIDATION_ERROR \(ERROR\)](#)
- [EPP_SERVICE_PORT_UNREACHABLE \(WARNING\)](#)
- [EPP_TLS_CONNECTION_ERROR \(ERROR\)](#)
- [EPP_XML_PARSE_ERROR \(ERROR\)](#)

▼ 7.72.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.72.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.72.6. Test suites

This test case is used in the following test suite(s):

- [Extensible Provisioning Protocol \(EPP\)](#)
-

7.73. epp-22 - Domain restore test

7.73.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.73.2. Description

This test will perform RGP restore operations on the objects deleted during epp-21, in order to confirm the correct operation of the server's implementation of RFC 3915.

Once the restore request has been processed, the client will perform <info> commands on the deleted object to confirm that the domain no longer has the pendingDelete status and RGP status.

▼ 7.73.3. Errors

This test case may produce the following errors:

- [EPP_DNS_RESOLUTION_ERROR \(CRITICAL\)](#)
- [EPP_LOGIN_ERROR \(CRITICAL\)](#)
- [EPP_NO_SERVICE_PORTS_REACHABLE \(CRITICAL\)](#)
- [EPP_RESTORE_DOMAIN_STILL_PENDINGDELETE \(ERROR\)](#)
- [EPP_SCHEMA_VALIDATION_ERROR \(ERROR\)](#)
- [EPP_SERVICE_PORT_UNREACHABLE \(WARNING\)](#)
- [EPP_TLS_CONNECTION_ERROR \(ERROR\)](#)
- [EPP_XML_PARSE_ERROR \(ERROR\)](#)

▼ 7.73.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- [epp.restoreReportRequired \(input\)](#)

▼ 7.73.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.73.6. Test suites

This test case is used in the following test suite(s):

- [Extensible Provisioning Protocol \(EPP\)](#)

7.74. epp-23 - Host rename test (if applicable)

7.74.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.74.2. Description

This test verifies the server's support for host rename operations.

If the `epp.hostModel` input parameter is `attributes`, this test will be skipped.

The client will perform <update> commands on the objects created during epp-11 and will confirm that the server correctly accepts or rejects the commands, for example:

- an <update> command which specifies a syntactically invalid host name is rejected;
- an <update> command which places the object out-of-bailiwick is accepted;
- an <update> command which places the object within a non-existent domain is rejected;
- an <update> command which places the object within a domain sponsored by another registrar is rejected. The domain name(s) provided in the `epp.registeredNames` parameter will be used for this test.
- an <update> command which places the object within a domain sponsored by the test client is accepted. A domain created during the `epp-14` test case will be used as the new parent domain.

The client will then perform <info> commands on the objects successfully updated, to confirm that the server has correctly stored the updated values.

▼ 7.74.3. Errors

This test case may produce the following errors:

- [EPP_DNS_RESOLUTION_ERROR \(CRITICAL\)](#)
- [EPP_HOST_RENAME_SERVER_ACCEPTS_INVALID_HOSTNAME \(ERROR\)](#)
- [EPP_HOST_RENAME_SERVER_ACCEPTS_RENAME_TO_ANOTHER_REGISTRARS_DOMAIN \(ERROR\)](#)
- [EPP_HOST_RENAME_SERVER_ACCEPTS_RENAME_TO_NONEXISTENT_DOMAIN \(ERROR\)](#)
- [EPP_HOST_RENAME_SERVER_REJECTS_OUT_OF_BAILIWICK_NAME \(ERROR\)](#)
- [EPP_HOST_RENAME_SERVER_UNEXPECTEDLY_REJECTS_RENAME \(ERROR\)](#)
- [EPP_LOGIN_ERROR \(CRITICAL\)](#)
- [EPP_NO_SERVICE_PORTS_REACHABLE \(CRITICAL\)](#)
- [EPP_SCHEMA_VALIDATION_ERROR \(ERROR\)](#)
- [EPP_SERVICE_PORT_UNREACHABLE \(WARNING\)](#)
- [EPP_TLS_CONNECTION_ERROR \(ERROR\)](#)
- [EPP_XML_PARSE_ERROR \(ERROR\)](#)

▼ 7.74.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.74.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.74.6. Test suites

This test case is used in the following test suite(s):

- [Extensible Provisioning Protocol \(EPP\)](#)
-

7.75. epp-24 - Host <delete> command test (if applicable)

7.75.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.75.2. Description

This test will perform <delete> commands on the objects created during epp-11 and will confirm that the server accepts the <delete> command with a 1xxx response code.

If the `epp.hostModel` input parameter is `attributes`, this test will be skipped.

Once the <delete> commands have been submitted, if a 1000 response was received from the server, the client will perform <check> and <info> commands to confirm that the objects have been deleted.

▼ 7.75.3. Errors

This test case may produce the following errors:

- [EPP_DNS_RESOLUTION_ERROR \(CRITICAL\)](#)
- [EPP_HOST_DELETE_INFO_RESPONSE_OBJECT_STILL_EXISTS \(ERROR\)](#)
- [EPP_LOGIN_ERROR \(CRITICAL\)](#)
- [EPP_NO_SERVICE_PORTS_REACHABLE \(CRITICAL\)](#)
- [EPP_SCHEMA_VALIDATION_ERROR \(ERROR\)](#)
- [EPP_SERVICE_PORT_UNREACHABLE \(WARNING\)](#)
- [EPP_TLS_CONNECTION_ERROR \(ERROR\)](#)
- [EPP_XML_PARSE_ERROR \(ERROR\)](#)

▼ 7.75.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.75.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

This test case is used in the following test suite(s):

- [Extensible Provisioning Protocol \(EPP\)](#)
-

7.76. idn-01 - Label validation test

7.76.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.76.2. Description

This test confirms that the EPP server correctly accepts or rejects domain <create> commands for valid and invalid IDN labels, respectively.

If there are no IDN tables supported under any of the TLDs associated with the test, then this test will be skipped.

For each supported IDN table, the test client will perform a series of <create> commands using a pre-defined catalogue of test labels. If required, the client will create any contact object(s) needed.

The server **MUST** reject all <create> commands for invalid labels and **MUST** accept all <create> commands for valid labels.

▼ 7.76.3. Errors

This test case may produce the following errors:

- [EPP_DNS_RESOLUTION_ERROR\(CRITICAL\)](#)
- [EPP_LOGIN_ERROR\(CRITICAL\)](#)
- [EPP_NO_SERVICE_PORTS_REACHABLE\(CRITICAL\)](#)
- [EPP_SCHEMA_VALIDATION_ERROR\(ERROR\)](#)
- [EPP_SERVICE_PORT_UNREACHABLE\(WARNING\)](#)
- [EPP_TLS_CONNECTION_ERROR\(ERROR\)](#)
- [EPP_XML_PARSE_ERROR\(ERROR\)](#)
- [IDN_SERVER_ACCEPTS_INVALID_LABEL\(ERROR\)](#)
- [IDN_SERVER_REJECTS_VALID_LABEL\(ERROR\)](#)

▼ 7.76.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.76.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

-

7.77. idn-02 - Level 1 variant handling test

7.77.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.77.2. Description

This test confirms the EPP server's conformance with the Level 1 variant support (no support for variant activation, all variants are blocked).

If there are no IDN tables for which Level 1 support is claimed, this test will be skipped.

For each supported IDN table, the test client will perform a series of <create> commands using a pre-defined catalogue of test labels. If required, the client will create any contact object(s) needed.

The client will then submit <create> commands for one or more labels that are variants of the names created in the first step. The server **MUST** reject these commands.

▼ 7.77.3. Errors

This test case may produce the following errors:

- [EPP_DNS_RESOLUTION_ERROR \(CRITICAL\)](#)
- [EPP_LOGIN_ERROR \(CRITICAL\)](#)
- [EPP_NO_SERVICE_PORTS_REACHABLE \(CRITICAL\)](#)
- [EPP_SCHEMA_VALIDATION_ERROR \(ERROR\)](#)
- [EPP_SERVICE_PORT_UNREACHABLE \(WARNING\)](#)
- [EPP_TLS_CONNECTION_ERROR \(ERROR\)](#)
- [EPP_XML_PARSE_ERROR \(ERROR\)](#)
- [IDN_VARIANT_LABEL_NOT_BLOCKED \(ERROR\)](#)

▼ 7.77.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.77.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.77.6. Test suites

This test case is used in the following test suite(s):

- [Internationalized Domain Names \(IDN\)](#)
-

7.78. idn-03 - Level 2 variant handling test

7.78.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.78.2. Description

This test confirms the EPP server's conformance with the Level 2 variant support (variants are supported within the same TLD).

If there are no IDN tables for which Level 2 support is claimed, this test will be skipped.

For each supported IDN table, the test client will perform a series of <create> commands using a pre-defined catalogue of test labels. If required, the client will create any contact object(s) needed.

The client will then submit <create> commands for one or more labels that are variants of the names created in the first step. Some of these commands will be made using the same registrar account as the first step, while some will be made using alternate credentials. If the value of the general.registryDataModel input parameter is maximum or per-registrar, then some commands will also use a different registrant contact.

The server **MUST** reject <create> commands where the (a) registrar is different from that of the primary label or (b) the registrant (if applicable) is different.

▼ 7.78.3. Errors

This test case may produce the following errors:

- [EPP_DNS_RESOLUTION_ERROR \(CRITICAL\)](#)
- [EPP_LOGIN_ERROR \(CRITICAL\)](#)
- [EPP_NO_SERVICE_PORTS_REACHABLE \(CRITICAL\)](#)
- [EPP_SCHEMA_VALIDATION_ERROR \(ERROR\)](#)
- [EPP_SERVICE_PORT_UNREACHABLE \(WARNING\)](#)
- [EPP_TLS_CONNECTION_ERROR \(ERROR\)](#)
- [EPP_XML_PARSE_ERROR \(ERROR\)](#)
- [IDN_VARIANT_SERVER_ACCEPTS_VARIANT_CREATE_FROM_INCORRECT_REGISTRAR \(ERROR\)](#)
- [IDN_VARIANT_SERVER_ACCEPTS_VARIANT_CREATE_WITH_INCORRECT_REGISTRANT \(ERROR\)](#)
- [IDN_VARIANT_SERVER_REJECTS_VARIANT_CREATE_FROM_SAME_REGISTRAR \(ERROR\)](#)
- [IDN_VARIANT_SERVER_REJECTS_VARIANT_CREATE_WITH_SAME_REGISTRANT \(ERROR\)](#)

▼ 7.78.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.78.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.78.6. Test suites

This test case is used in the following test suite(s):

- [Internationalized Domain Names \(IDN\)](#)

7.79. idn-04 - Level 3 variant handling test

7.79.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.79.2. Description

This test confirms the EPP server's conformance with the Level 3 variant support (variants are supported within variant TLD(s)).

If there are no IDN tables for which Level 3 support is claimed, this test will be skipped.

For each supported IDN table, the test client will perform a series of <create> commands using a pre-defined catalogue of test labels. If required, the client will create any contact object(s) needed.

The client will then submit <create> commands for one or more labels that are variants (at both second- and top-level) of the names created in the first step. Some of these commands will be made using the same registrar account as the first step, while some will be made using alternate credentials. If the value of the general.registryDataModel input parameter is maximum or per-registrar, then some commands will also use a different registrant contact.

The server **MUST** reject <create> commands where the (a) registrar is different from that of the primary label or (b) the registrant (if applicable) is different.

▼ 7.79.3. Errors

This test case may produce the following errors:

- [EPP_DNS_RESOLUTION_ERROR \(CRITICAL\)](#)
- [EPP_LOGIN_ERROR \(CRITICAL\)](#)

7.80. integration-01 - EPP → RDAP Integration Test

7.80.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.80.2. Description

This test confirms that the EPP and RDAP systems are properly integrated, that is, that transform commands performed on objects in the EPP system are reflected in the RDAP system within the Service Level Requirement of the SLA.

The test system will connect to the EPP server and create domain and (if applicable) host and contact objects using the same methodology as `epp-14` `epp-11`. It will then perform RDAP queries for those objects.

The RDAP server **MUST** provide a 200 response for every object created within 1 hour of the object's `<crDate>` element.

▼ 7.80.3. Errors

This test case may produce the following errors:

- [EPP_DNS_RESOLUTION_ERROR \(CRITICAL\)](#)
- [EPP_GENERIC_COMMAND_ERROR \(ERROR\)](#)
- [EPP_LOGIN_ERROR \(CRITICAL\)](#)
- [EPP_NO_SERVICE_PORTS_REACHABLE \(CRITICAL\)](#)

-

7.82. integration-03 - EPP → RDE Integration Test

7.82.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.82.2. Description

This test confirms that the EPP and RDE systems are properly integrated, that is, that objects created in the EPP system are reflected in a valid RDE deposit file within the Service Level Requirement of the SLA.

The test system will periodically connect to the SFTP server specified by the `integration.rdeSFTPHostname` input parameter, using the username specified in the `integration.rdeSFTPUsername` input parameter and the SSH key in the `integration.rdeSFTPPublicKey` resource, and look for `.ryde` files in the directory specified by the `integration.rdeSFTPDirectory` input parameter. Note that operators **MUST** ensure that the IP addresses listed in the `integration.rdeSFTPACL` resource have been added to the Access Control List for the SFTP server (if any).

All objects created in the `integration-01` test case **MUST** be found within a valid RDE deposit file (that is, the deposit passes all the tests in the RDE test suite) within 24 hours of each object's `<crDate>` element.

Furthermore, for each deposit found in the directory, the corresponding RDE report (as described in [Section 2.1 of draft-lozano-icann-registry-interfaces](#)) **MUST** be received on the test RRI environment before 23:59:59 UTC on the date specified in the Watermark element of the deposit file.

To facilitate submission of RDE reports, the RRI test environment will be configured to accept submissions for the TLDs associated with the test from clients using the same TLSA DNS hostnames that are configured for the test.

▼ 7.82.3. Errors

This test case may produce the following errors:

- [INTEGRATION_DOMAIN_NOT_PRESENT_IN_RDE \(ERROR\)](#)
- [INTEGRATION_RDE_SFTP_SERVER_AUTHENTICATION_ERROR \(WARNING\)](#)
- [INTEGRATION_RDE_SFTP_SERVER_UNREACHABLE \(WARNING\)](#)

▼ 7.82.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- [integration.rdeSFTPDirectory \(input\)](#)
- [integration.rdeSFTPHostname \(input\)](#)
- [integration.rdeSFTPUsername \(input\)](#)

▼ 7.82.6. Test suites

This test case is used in the following test suite(s):

- [Standard Integration Test](#)

7.83. minimumRPMs-01 - Claims <check> command test

7.83.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.83.2. Description

This test is used to confirm the conformance of the EPP server's implementation of the Claims Check Form, as described in Section 3.1.1 of RFC 8334.

For this test, the applicant must configure their system using the test TMCH data files found in the following resources:

- tmch.testCert
- tmch.testCRL
- tmch.testDNL
- tmch.testSMDRL
- tmch.testSURL

The client will connect to the EPP server using the provided credentials and will then perform a series of <check> commands, using the Launch extension to specify a value of claims for the type attribute of the <launch:check> element and the <launch:phase> element. It will then confirm that the server returns an appropriate response:

- a <check> response for a domain that is present on the DNL contains the correct <launch:claimKey> element;
- a <check> response for a domain that is NOT present on the DNL does not contain a <launch:claimKey> element.

▼ 7.83.3. Errors

This test case may produce the following errors:

- [EPP_DNS_RESOLUTION_ERROR \(CRITICAL\)](#)
- [EPP_LOGIN_ERROR \(CRITICAL\)](#)
- [EPP_NO_SERVICE_PORTS_REACHABLE \(CRITICAL\)](#)
- [EPP_SCHEMA_VALIDATION_ERROR \(ERROR\)](#)

▼ 7.83.6. Test suites

This test case is used in the following test suite(s):

- [Minimum Rights Protection Mechanisms \(RPMs\)](#)

7.84. minimumRPMs-02 - Sunrise domain/launch application <create> command test

7.84.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.84.2. Description

This test is used to confirm the conformance of the EPP server's implementation of the Sunrise Create Form, as described in Section 3.3.1 of RFC 8334.

For this test, the applicant must configure their system using the test TMCH data files found in the following resources:

- tmch.testCert
- tmch.testCRL
- tmch.testDNL
- tmch.testSMDRL
- tmch.testSURL

The client will connect to the EPP server and will submit <create> commands, using domain names and SMD files present in the TMCH test environment.

If the server supports Start Date sunrises, the fully-qualified domain name will be constructed using a label from the SMD file and the `minimumRPMS.sunriseTLD` input parameter. If the domain is not already present in the registry, the Server **MUST** respond with a 1000 or 1001 result code, however, if the client receives a 2302 “object exists” result code, it will retry with a different domain name, until a 1000 or 1001 response is received.

If the server supports End Date sunrises, the fully-qualified domain name will be constructed using a label from the SMD file and the `minimumRPMS.sunriseTLD` input parameter. The Server **MUST** respond with a 1000 or 1001 result code, and create a launch application.

Once the <create> commands have been processed, the client will then perform <info> commands to confirm that the domains or launch applications have been created and that the submitted object properties have been correctly stored.

The client will also confirm that the server rejects attempts to:

1. create a domain using an expired SMD;
2. create a domain using a revoked SMD;
3. create a domain using an SMD signed by a revoked certificate.
4. create a domain using an SMD for a different domain.

▼ 7.84.3. Errors

This test case may produce the following errors:

- [EPP_DNS_RESOLUTION_ERROR \(CRITICAL\)](#)
- [EPP_LOGIN_ERROR \(CRITICAL\)](#)
- [EPP_NO_SERVICE_PORTS_REACHABLE \(CRITICAL\)](#)

- [RPMS_SUNRISE_CREATE_UNEXPECTED_SUCCESS_USING_SMD_WITH_REVOKED_SIGNATURE \(ERROR\)](#)

▼ 7.84.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.84.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.84.6. Test suites

This test case is used in the following test suite(s):

- [Minimum Rights Protection Mechanisms \(RPMS\)](#)

7.85. minimumRPMS-03 - Trademark claims domain <create> command test

7.85.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.85.2. Description

This test is used to confirm the conformance of the EPP server's implementation of the Claims Create Form, as described in Section 3.3.2 of RFC 8334.

For this test, the applicant must configure their system using the test TMCH data files found in the following resources:

- tmch.testCert
- tmch.testCRL
- tmch.testDNL
- tmch.testSMDRL
- tmch.testSURL

The client will connect to the EPP server and will submit <create> commands, using domain names present in the TMCH test environment.

The domain name will be constructed using a label from the DNL, and the `minimumRPMS.claimsTLD` input parameter. The client will perform a Trademark Claims <check> command beforehand to obtain the claim key, and will then synthesise a trademark claims acknowledgement. The server **MUST** respond with a 1000 or 1001 response.

Once the <create> commands have been processed, the client will then perform <info> commands to confirm that the domains have been created and that the submitted object properties have been correctly stored.

The client will also confirm that the server rejects attempts to:

1. create a domain using an invalid claim key;
2. create a domain using an expired claim key;
3. create a domain using an acceptance datetime more than 12 months in the past.

▼ 7.85.3. Errors

This test case may produce the following errors:

- [EPP_DNS_RESOLUTION_ERROR \(CRITICAL\)](#)
- [EPP_LOGIN_ERROR \(CRITICAL\)](#)
- [EPP_NO_SERVICE_PORTS_REACHABLE \(CRITICAL\)](#)
- [EPP_SCHEMA_VALIDATION_ERROR \(ERROR\)](#)
- [EPP_SERVICE_PORT_UNREACHABLE \(WARNING\)](#)

- [EPP_TLS_CONNECTION_ERROR \(ERROR\)](#)
- [EPP_XML_PARSE_ERROR \(ERROR\)](#)
- [RPMS_TRADEMARK_CREATE_INFO_OBJECT_DOES_NOT_EXIST \(ERROR\)](#)
- [RPMS_TRADEMARK_CREATE_INFO_OBJECT_IS_HAS_MISSING_OR_INVALID_PROPERTIES \(ERROR\)](#)
- [RPMS_TRADEMARK_CREATE_UNEXPECTED_FAILURE_USING_VALID_CLAIM_KEY \(ERROR\)](#)
- [RPMS_TRADEMARK_CREATE_UNEXPECTED_SUCCESS_USING_INVALID_ACCEPTANCE_DATE \(ERROR\)](#)
- [RPMS_TRADEMARK_CREATE_UNEXPECTED_SUCCESS_USING_INVALID_CLAIM_KEY \(ERROR\)](#)

▼ 7.85.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.85.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.85.6. Test suites

This test case is used in the following test suite(s):

- [Minimum Rights Protection Mechanisms \(RPMs\)](#)
-

7.86. rdap-01-ipv4Validation - IPv4 address validation

7.86.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.86.2. Description

This test case comes from the RDAP Conformance Tool. For more information, see <https://github.com/icann/rdap-conformance-tool/blob/master/doc/RDAPConformanceToolSpecifications.pdf>.

▼ 7.86.3. Errors

This test case may produce the following errors:

- [RDAP_01_IPV4VALIDATION_FAILED \(ERROR\)](#)

▼ 7.86.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.86.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.86.6. Test suites

This test case is used in the following test suite(s):

- [Registration Data Access Protocol \(RDAP\)](#)
-

7.87. rdap-02-ipv6Validation - IPv6 address validation

7.87.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.87.2. Description

This test case comes from the RDAP Conformance Tool. For more information, see <https://github.com/icann/rdap-conformance-tool/blob/master/doc/RDAPConformanceToolSpecifications.pdf>.

▼ 7.87.3. Errors

This test case may produce the following errors:

- [RDAP_02_IPV6VALIDATION_FAILED \(ERROR\)](#)

▼ 7.87.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.87.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.87.6. Test suites

This test case is used in the following test suite(s):

- [Registration Data Access Protocol \(RDAP\)](#)
-

7.88. rdap-03-domainNameValidation - Domain Name validation

7.88.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.88.2. Description

This test case comes from the RDAP Conformance Tool. For more information, see <https://github.com/icann/rdap-conformance-tool/blob/master/doc/RDAPConformanceToolSpecifications.pdf>.

▼ 7.88.3. Errors

This test case may produce the following errors:

- [RDAP_03_DOMAINNAMEVALIDATION_FAILED_\(ERROR\)](#)

▼ 7.88.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.88.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.88.6. Test suites

This test case is used in the following test suite(s):

- [Registration Data Access Protocol \(RDAP\)](#)
-

7.89. rdap-04-webUriValidation - Web URI validation

7.89.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.89.2. Description

This test case comes from the RDAP Conformance Tool. For more information, see <https://github.com/icann/rdap-conformance-tool/blob/master/doc/RDAPConformanceToolSpecifications.pdf>.

▼ 7.89.3. Errors

This test case may produce the following errors:

- **GAMMA:** finalized and ready for review

7.110.2. Description

This test case comes from the RDAP Conformance Tool. For more information, see <https://github.com/icann/rdap-conformance-tool/blob/master/doc/RDAPConformanceToolSpecifications.pdf>.

▼ 7.110.3. Errors

This test case may produce the following errors:

- [RDAP_25_STDRDAPNAMESERVERLOOKUPVALIDATION_FAILED \(ERROR\)](#)

▼ 7.110.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.110.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.110.6. Test suites

This test case is used in the following test suite(s):

- [Registration Data Access Protocol \(RDAP\)](#)
-

7.111. rdap-26-stdRdapHelpValidation - Help validation

7.111.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.111.2. Description

This test case comes from the RDAP Conformance Tool. For more information, see <https://github.com/icann/rdap-conformance-tool/blob/master/doc/RDAPConformanceToolSpecifications.pdf>.

▼ 7.111.3. Errors

This test case may produce the following errors:

- [RDAP_26_STDRDAPHELPVALIDATION_FAILED \(ERROR\)](#)

▼ 7.111.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.111.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.111.6. Test suites

This test case is used in the following test suite(s):

- [Registration Data Access Protocol \(RDAP\)](#)
-

7.112. rdap-27-stdRdapNameserversSearchValidation - Nameservers search validation

7.112.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.112.2. Description

This test case comes from the RDAP Conformance Tool. For more information, see <https://github.com/icann/rdap-conformance-tool/blob/master/doc/RDAPConformanceToolSpecifications.pdf>.

▼ 7.112.3. Errors

This test case may produce the following errors:

- [RDAP_27_STDRDAPNAMESERVSEARCHVALIDATION_FAILED \(ERROR\)](#)

▼ 7.112.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.112.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.112.6. Test suites

This test case is used in the following test suite(s):

- [Registration Data Access Protocol \(RDAP\)](#)
-

7.113. rdap-91 - TLS version conformance check

7.113.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.113.2. Description

NOTE: this test case is a placeholder for a test case that will eventually be added to the RDAP Conformance Tool.

This test case verifies that the RDAP server properly implements a secure TLS configuration.

1. All service ports **MUST** support TLSv1.2 and optionally any subsequent protocol published by the IETF.
2. TLSv1.1 and all previous versions have known security issues and **MUST NOT** be supported by any service ports.
3. To ensure that the connection can be trusted, all service ports **MUST** present a certificate issued by a trusted CA, such as those supported by major browsers (see the `epp.tlsCertificateStore` resource).
4. All TLS certificates **MUST NOT** have expired, and **MUST** be presented with any required intermediate certificates.
5. The RDAP server name **MUST** match at least one `subjectAltName` field in all presented certificates (either exact match or wildcard).
6. Service ports **MUST** use at least one of the ciphers recommended in RFC 9325 (or any successor document).

▼ 7.113.3. Errors

This test case may produce the following errors:

- [RDAP_TLS_BAD_CIPHER \(ERROR\)](#)
- [RDAP_TLS_CERTIFICATE_CHAIN_MISSING \(ERROR\)](#)
- [RDAP_TLS_CERTIFICATE_HOSTNAME_MISMATCH \(ERROR\)](#)
- [RDAP_TLS_DNS_RESOLUTION_ERROR \(ERROR\)](#)
- [RDAP_TLS_EXPIRED_CERTIFICATE \(ERROR\)](#)
- [RDAP_TLS_FORBIDDEN_PROTOCOL_SUPPORTED \(ERROR\)](#)
- [RDAP_TLS_NO_SERVICE_PORTS_REACHABLE \(CRITICAL\)](#)
- [RDAP_TLS_REQUIRED_PROTOCOL_NOT_SUPPORTED \(ERROR\)](#)
- [RDAP_TLS_SERVICE_PORT_UNREACHABLE \(ERROR\)](#)
- [RDAP_TLS_UNTRUSTED_CERTIFICATE \(ERROR\)](#)

▼ 7.113.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.113.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- [epp.tlsCertificateStore](#)

▼ 7.113.6. Test suites

This test case is used in the following test suite(s):

- [Registration Data Access Protocol \(RDAP\)](#)

7.114. rdap-92 - Service port consistency check

7.114.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.114.2. Description

NOTE: this test case is a placeholder for a test case that will eventually be added to the RDAP Conformance Tool.

This test confirms that all RDAP service ports return identical responses.

Since applicants must provide an RDAP service over both IPv4 and IPv6, at least two service ports will be checked.

The client will establish separate connections to each RDAP service port (defined as an IP address and TCP port, where at least one IPv4 address/port pair and IPv6 address/port pair are expected) and perform RDAP queries on the objects specified in the `rdap.testDomains`, `rdap.testEntities`, and `rdap.testNameservers` input parameters.

The responses returned by each service port **MUST**, with the exception of the last update of RDAP database event, be consistent, once the JSON body has been parsed and canonicalised.

▼ 7.114.3. Errors

This test case may produce the following errors:

- [RDAP SERVICE PORT NOT CONSISTENT \(ERROR\)](#)
- [RDAP TLS DNS RESOLUTION ERROR \(ERROR\)](#)
- [RDAP TLS NO SERVICE PORTS REACHABLE \(CRITICAL\)](#)
- [RDAP TLS SERVICE PORT UNREACHABLE \(ERROR\)](#)

▼ 7.114.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.114.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.114.6. Test suites

This test case is used in the following test suite(s):

- [Registration Data Access Protocol \(RDAP\)](#)
-

7.115. rde-01 - validate deposit filename format

7.115.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.115.2. Description

- The deposit filename **MUST** conform to the format specified in the RA.
- The type of the deposit **MUST** be FULL.
- The TLD in the filename **MUST** be present in the list of TLDs associated with the test.

▼ 7.115.3. Errors

This test case may produce the following errors:

- [RDE_INVALID_FILENAME \(ERROR\)](#)

▼ 7.115.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.115.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.115.6. Test suites

This test case is used in the following test suite(s):

- [Registry Data Escrow \(RDE\)](#)
-

7.116. rde-02 - validate signature over deposit file

7.116.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.116.2. Description

The PGP signature **MUST** be valid for the deposit file and the RSP's key.

▼ 7.116.3. Errors

This test case may produce the following errors:

- [RDE_INVALID_SIGNATURE\(ERROR\)](#)

▼ 7.116.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- [rde.publicKey\(file\)](#)
- [rde.signatureFile\(file\)](#)

▼ 7.116.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.116.6. Test suites

This test case is used in the following test suite(s):

- [Registry Data Escrow \(RDE\)](#)
-

7.117. rde-03 - decrypt deposit file(s)

7.117.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.117.2. Description

It **MUST** be possible to decrypt the deposit file using the RST key. The PGP public key for which the deposit **MUST** be encrypted may be found in the URL specified by the `rde.encryptionKey` resource.

▼ 7.117.3. Errors

This test case may produce the following errors:

- [RDE_DECRIPTION_FAILED \(ERROR\)](#)

▼ 7.117.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.117.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- [rde.encryptionKey](#)

▼ 7.117.6. Test suites

This test case is used in the following test suite(s):

- [Registry Data Escrow \(RDE\)](#)
-

7.118. rde-04 - validate XML/CSV

7.118.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.118.2. Description

- XML deposit files **MUST** be well-formed and validate against the XML schema.
- CSV files **MUST** conform to RFC 4180.
- Deposits **MUST NOT** contain a mix of XML and CSV files for the deposit contents.

▼ 7.118.3. Errors

This test case may produce the following errors:

- [RDE_INVALID_CSV \(ERROR\)](#)
- [RDE_MIXED_TYPES \(ERROR\)](#)
- [RDE_SCHEMA_VALIDATION_ERROR \(ERROR\)](#)
- [RDE_XML_PARSE_ERROR \(ERROR\)](#)

▼ 7.118.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.118.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.118.6. Test suites

This test case is used in the following test suite(s):

- [Registry Data Escrow \(RDE\)](#).
-

7.119. rde-05 - validate object types

7.119.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.119.2. Description

The header object **MUST** reference the correct object XML namespace URIs.

The correct URIs are determined by the general.registryDataModel and epp.hostModel input parameters.

- if the general.registryDataModel input parameter is maximum or per-registrar, then the contact URI **MUST** be present. If the value is true, then it **MUST NOT** be present.
- if the epp.hostModel input parameter is 'objects', then the host URI **MUST** be present. If the value is attributes, then it **MUST NOT** be present.

All expected URIs **MUST** be present in the header, and the header **MUST NOT** contain any unexpected URIs.

▼ 7.119.3. Errors

This test case may produce the following errors:

- [RDE_MISSING_OBJECT_URL\(ERROR\)](#)
- [RDE_UNEXPECTED_OBJECT_URI\(ERROR\)](#)

▼ 7.119.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.119.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.119.6. Test suites

This test case is used in the following test suite(s):

- [Registry Data Escrow \(RDE\)](#)
-

7.120. rde-06 - validate object counts

7.120.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.120.2. Description

The number of each type of object **MUST** match the number of objects actually present in the deposit file.

▼ 7.120.3. Errors

This test case may produce the following errors:

- [RDE_OBJECT_COUNT_MISMATCH \(ERROR\)](#)

▼ 7.120.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.120.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.120.6. Test suites

This test case is used in the following test suite(s):

- [Registry Data Escrow \(RDE\)](#)

7.121. rde-07 - validate domain objects

7.121.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.121.2. Description

Domain objects (whether CSV or XML) **MUST** have the required object properties, and the values of those object properties **MUST** be well-formed.

The required properties are:

- <domain:name>
- <domain:roid> (which **MUST** have a repository ID registered with IANA)
- at least one <domain:status> element
- <domain:registrant> (if general.registryDataModel is maximum)
- <domain:cLID> (sponsoring registrar ID)
- <domain:crDate> (creation date), which **MUST** be before the timestamp in the deposit's '<watermark>' element.
- <domain:exDate> (expiry date), which **MUST** be after the timestamp in the deposit's '<watermark>' element, unless the domain has the pendingDelete status.

Contact, host and registrar objects (including optional objects such as admin and tech contacts) which are referenced in domain objects **MUST** be present in the deposit.

▼ 7.121.3. Errors

This test case may produce the following errors:

- [RDE_DOMAIN_HAS_INVALID_CLID\(ERROR\)](#)
- [RDE_DOMAIN_HAS_INVALID_CRDATE\(ERROR\)](#)
- [RDE_DOMAIN_HAS_INVALID_EXDATE\(ERROR\)](#)
- [RDE_DOMAIN_HAS_INVALID_NAME\(ERROR\)](#)
- [RDE_DOMAIN_HAS_INVALID_REGISTRANT\(ERROR\)](#)
- [RDE_DOMAIN_HAS_INVALID_ROID\(ERROR\)](#)
- [RDE_DOMAIN_HAS_INVALID_STATUS\(ERROR\)](#)
- [RDE_DOMAIN_HAS_MISSING_CLID\(ERROR\)](#)
- [RDE_DOMAIN_HAS_MISSING_CRDATE\(ERROR\)](#)
- [RDE_DOMAIN_HAS_MISSING_EXDATE\(ERROR\)](#)
- [RDE_DOMAIN_HAS_MISSING_REGISTRANT\(ERROR\)](#)
- [RDE_DOMAIN_HAS_MISSING_ROID\(ERROR\)](#)
- [RDE_DOMAIN_HAS_MISSING_STATUS\(ERROR\)](#)

▼ 7.121.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.121.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.121.6. Test suites

This test case is used in the following test suite(s):

- [Registry Data Escrow \(RDE\)](#)
-

7.122. rde-08 - validate host objects (if applicable)

7.122.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.122.2. Description

Host objects (whether CSV or XML) **MUST** have the required object properties, and the values of those object properties **MUST** be well-formed.

The required properties are:

- <host:name>
- <host:roid> (which **MUST** have a repository ID registered with IANA)
- at least one <domain:status> element
- one or more <addr> elements (if the host name is subordinate to the TLD)
- <host:clid> (sponsoring registrar ID)

If the applicant uses the host attribute model, then this test will be skipped.

Registrar objects which are referenced in host objects **MUST** be present in the deposit.

▼ 7.122.3. Errors

This test case may produce the following errors:

- [RDE_HOST_HAS_INVALID_CLID\(ERROR\)](#)
- [RDE_HOST_HAS_INVALID_IP_ADDRESS\(ERROR\)](#)
- [RDE_HOST_HAS_INVALID_NAME\(ERROR\)](#)
- [RDE_HOST_HAS_INVALID_ROID\(ERROR\)](#)
- [RDE_HOST_HAS_INVALID_STATUS\(ERROR\)](#)

- [RDE_HOST_HAS_MISSING_IP_ADDRESS\(ERROR\)](#)
- [RDE_HOST_HAS_MISSING_ROID\(ERROR\)](#)
- [RDE_HOST_HAS_MISSING_STATUS\(ERROR\)](#)

▼ 7.122.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.122.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.122.6. Test suites

This test case is used in the following test suite(s):

- [Registry Data Escrow \(RDE\)](#)
-

7.123. rde-09 - validate contact objects (if applicable)

7.123.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.123.2. Description

Contact objects (whether CSV or XML) **MUST** have the required object properties, and the values of those object properties **MUST** be well-formed.

If the value of the general.registryDataModel input parameter is minimum, then this test will be skipped.

- The value of the <contact:id> element **MUST** be unique in the deposit
- The value of the <contact:roid> **MUST** have a repository ID registered with IANA
- The object **MUST NOT** have two <rdeContact:postalInfo> elements with the same type attribute
- The value of the <contact:cc> element **MUST** contain a value on the ISO-3166-alpha-2 list
- The value of the <contact:email> element **MUST** be a valid mailbox

Registrar objects which are referenced in contact objects **MUST** be present in the deposit.

▼ 7.123.3. Errors

This test case may produce the following errors:

- [RDE_CONTACT_HAS_INVALID_CC \(ERROR\)](#)
- [RDE_CONTACT_HAS_INVALID_EMAIL \(ERROR\)](#)
- [RDE_CONTACT_HAS_INVALID_ROID \(ERROR\)](#)
- [RDE_CONTACT_HAS_MULTIPLE_POSTALINFO_TYPES \(ERROR\)](#)
- [RDE_CONTACT_HAS_NON_UNIQUE_ID \(ERROR\)](#)

- [Registry Data Escrow \(RDE\)](#)
-

7.125. rde-11 - validate IDN table objects (if applicable)

7.125.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.125.2. Description

IDN table objects (whether CSV or XML) **MUST** have the required object properties, and the values of those object properties **MUST** be well-formed.

All IDN table objects present in the deposit **MUST** correspond to IDN tables approved for the TLD, and all approved tables **MUST** have a corresponding object in the deposit.

▼ 7.125.3. Errors

This test case may produce the following errors:

- [RDE_IDN_OBJECT_INVALID \(ERROR\)](#)
- [RDE_IDN_OBJECT_MISSING \(ERROR\)](#)
- [RDE_IDN_OBJECT_UNEXPECTED \(ERROR\)](#)

▼ 7.125.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.125.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

This test case is used in the following test suite(s):

- [Registry Data Escrow \(RDE\)](#)
-

7.129. srsgw-01 - IPv4 and IPv6 connectivity

7.129.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.129.2. Description

This test confirms that the SRS Gateway EPP system is reachable over IPv4 and IPv6.

The SRS Gateway EPP server host name will be resolved to obtain its IPv4 and IPv6 addresses. The client will then attempt to connect to TCP port 700 on these addresses and log in using the provided credentials.

▼ 7.129.3. Errors

This test case may produce the following errors:

- [EPP_DNS_RESOLUTION_ERROR \(CRITICAL\)](#)
- [EPP_LOGIN_ERROR \(CRITICAL\)](#)
- [EPP_NO_SERVICE_PORTS_REACHABLE \(CRITICAL\)](#)
- [EPP_SCHEMA_VALIDATION_ERROR \(ERROR\)](#)
- [EPP_SERVICE_PORT_UNREACHABLE \(WARNING\)](#)
- [EPP_TLS_CONNECTION_ERROR \(ERROR\)](#)
- [EPP_XML_PARSE_ERROR \(ERROR\)](#)

▼ 7.129.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.129.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.129.6. Test suites

This test case is used in the following test suite(s):

- [SRS Gateway](#)
-

7.130. srsgw-02 - Host <create> synchronization (if applicable)

7.130.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.130.2. Description

This test confirms that host objects created in the SRS Gateway EPP system are correctly synchronized with the primary registry system.

If the value of the `epp.hostModel` input parameter is `attributes`, then this test will be skipped.

The client will connect to the SRS Gateway EPP system, authenticate, and submit a `<create>` command for a pseudo-randomly generated host name. IP address information will be provided if required. The server **MUST** respond with a 1000 or 1001 response. The client will then perform an `<info>` command and will capture the response.

It will then connect to the primary EPP system, authenticate, and perform an `<info>` command for the object created in the first step. If the server responds with a 2303 response, it will wait for 30 seconds and retry. The server **MUST** respond to the first or second `<info>` command with a 1000 response.

The two `<info>` responses will then be compared and **MUST** be identical.

▼ 7.130.3. Errors

This test case may produce the following errors:

- [EPP_DNS_RESOLUTION_ERROR \(CRITICAL\)](#)
- [EPP_LOGIN_ERROR \(CRITICAL\)](#)
- [EPP_NO_SERVICE_PORTS_REACHABLE \(CRITICAL\)](#)
- [EPP_SCHEMA_VALIDATION_ERROR \(ERROR\)](#)

▼ 7.130.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.130.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

- *None specified.*

▼ 7.130.6. Test suites

This test case is used in the following test suite(s):

- [SRS Gateway](#)
-

7.131. srsgw-03 - Contact <create> synchronization (if applicable)

7.131.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.131.2. Description

This test confirms that contact objects created in the SRS Gateway EPP system are correctly synchronized with the primary registry system.

If the `general.registryDataModel` input parameter is `minimum`, this test will be skipped. Otherwise, this client will select the appropriate registrar credentials based on the values of the `epp.clid01DataModel` and `epp.clid02DataModel` input parameters.

The client will connect to the SRS Gateway EPP system, authenticate, and submit a `<create>` command for a pseudo-randomly generated contact object. The client will then perform an `<info>` command and will capture the response.

It will then connect to the primary EPP system, authenticate, and perform an `<info>` command for the object created in the first step. If the server responds with a 2303 response, it will wait for 30 seconds and retry. The server **MUST** respond to the first or second `<info>` command with a 1000 response.

The two `<info>` responses will then be compared and **MUST** be identical.

▼ 7.131.3. Errors

This test case may produce the following errors:

- [EPP_DNS_RESOLUTION_ERROR \(CRITICAL\)](#)
- [EPP_LOGIN_ERROR \(CRITICAL\)](#)
- [EPP_NO_SERVICE_PORTS_REACHABLE \(CRITICAL\)](#)
- [EPP_SCHEMA_VALIDATION_ERROR \(ERROR\)](#)
- [EPP_SERVICE_PORT_UNREACHABLE \(WARNING\)](#)
- [EPP_TLS_CONNECTION_ERROR \(ERROR\)](#)
- [EPP_XML_PARSE_ERROR \(ERROR\)](#)
- [SRSGW_CONTACT_CREATE_FAILED \(CRITICAL\)](#)
- [SRSGW_CONTACT_CREATE_OBJECT_HAS_MISSING_OR_INVALID_PROPERTIES \(ERROR\)](#)
- [SRSGW_CONTACT_CREATE_OBJECT_NOT_FOUND_WITHIN_DEADLINE \(ERROR\)](#)

▼ 7.131.4. Input parameters

This test case requires the following input parameters, in addition to those defined in the test suite:

- *None specified.*

▼ 7.131.5. Resources

The following resources may be required to prepare for this test case, in addition to those defined in the test suite:

▼ 7.131.6. Test suites

This test case is used in the following test suite(s):

- [SRS Gateway](#)

7.132. srsgw-04 - Domain <create> synchronization

7.132.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.132.2. Description

This test confirms that domain objects created in the SRS Gateway EPP system are correctly synchronized with the primary registry system.

The client will connect to the SRS Gateway EPP system, authenticate, and submit <create> commands for a pseudo-randomly generated domain names. Contact and nameserver objects created in srsgw-02 and srsgw-03 will be used if required. The server **MUST** respond with 1000 or 1001 responses. The client will then perform <info> commands and will capture the responses.

It will then connect to the primary EPP system, authenticate, and perform <info> commands for the domains created in the first step. If the server responds with a 2303 response, it will wait for 30 seconds and retry. The server **MUST** respond to the first or second <info> command with a 1000 response.

The pairs of <info> responses will then be compared and **MUST** be identical.

▼ 7.132.3. Errors

This test case may produce the following errors:

- [EPP_DNS_RESOLUTION_ERROR \(CRITICAL\)](#)
- [EPP_LOGIN_ERROR \(CRITICAL\)](#)
- [EPP_NO_SERVICE_PORTS_REACHABLE \(CRITICAL\)](#)
- [EPP_SCHEMA_VALIDATION_ERROR \(ERROR\)](#)

This test case is used in the following test suite(s):

- [SRS Gateway](#)
-

7.134. srsgw-06 - Domain <transfer> synchronisation

7.134.1. Maturity Level

- **GAMMA:** finalized and ready for review

7.134.2. Description

This test confirms that transfer requests submitted in the SRS Gateway EPP system are correctly synchronized with the primary registry system.

The client will connect to the SRS Gateway EPP system, authenticate, and perform an <update> command to specify an authInfo code for the domain created in srsgw-04. The server **MUST** respond with a 1000 or 1001 response.

It will then reconnect to the SRS Gateway EPP system using the credentials of a second registrar account and submit a <transfer op="request"> command using the authInfo command set for the domain in the first step. The server **MUST** respond with a 1000 or 1001 response.

It will then connect to the primary EPP system, authenticate, and perform an <info> command for the domain. The server **MUST** respond with a 1000 response.

- if the response to the original <transfer op="request"> command was 1000, then the <cID> element **MUST** contain the value of the srsgw.eppClid01 input parameter.
- if the response to the <transfer op="request"> command was 1001, then the domain **MUST** have the pendingTransfer status.

▼ 7.134.3. Errors

This test case may produce the following errors:

- [EPP_DNS_RESOLUTION_ERROR \(CRITICAL\)](#)
- [EPP_LOGIN_ERROR \(CRITICAL\)](#)
- [EPP_NO_SERVICE_PORTS_REACHABLE \(CRITICAL\)](#)
- [EPP_SCHEMA_VALIDATION_ERROR \(ERROR\)](#)

8. Input Parameters

8.1. dns.nameservers

8.1.1. Description

The set of nameservers that will be authoritative for the zones used in the DNSSEC operations test suite.

▼ 8.1.2. Example

```
{
  "dns.nameservers" : [
    {
      "name" : "ns1.example.com",
      "v4Addrs" : [
        "192.0.2.1"
      ],
      "v6Addrs" : [
        "2001:DB8::53:1"
      ]
    },
    {
      "name" : "ns2.example.net",
      "v4Addrs" : [
        "192.0.2.2"
      ],
      "v6Addrs" : [
        "2001:DB8::53:2"
      ]
    }
  ]
}
```

▼ 8.1.3. Schema

```
items:
properties:
  name:
    description: The fully-qualified nameserver name.
    format: hostname
    type: string
  v4Addrs:
    description: The IPv4 address(es) for the nameserver.
    items:
      format: ipv4
      type: string
    minItems: 1
    type: array
  v6Addrs:
    description: The IPv6 address(es) for the nameserver.
    items:
      format: ipv6
      type: string
    minItems: 1
    type: array
  required:
```

```
- name
- addrs
  type: object
minItems: 1
type: array
```

This input parameter is also used in the following test suites:

- [Authoritative DNS Service](#)
- [DNS Security Extensions \(DNSSEC\)](#)

8.2. dnssec.dsRecords

8.2.1. Description

The DS record(s) that may be used to validate the DNSSEC signature for the TLD(s). This input parameter is an object where the object properties are the TLD names and the values are arrays of objects representing DS records.

There **MUST** be an entry for every TLD in the TLD set and there **MUST** be at least one DS record for each TLD.

▼ 8.2.2. Example

```
{
  "dnssec.dsRecords" : [
    {
      "dsRecords" : [
        {
          "alg" : 8,
          "digest" : "E06D44B80B8F1D39A95C0B0D7C65D08458E880409BBC683457104237C7F8EC8D",
          "digestType" : 2,
          "keyTag" : 12345
        }
      ],
      "name" : "example"
    }
  ]
}
```

▼ 8.2.3. Schema

```
items:
properties:
  dsRecords:
    description: the DS record(s)
    items:
      properties:
        alg:
          format: uint16
          type: integer
        digest:
```

```
pattern: ^[0-9A-Fa-f]+$
type: string
digestType:
  format: uint16
  type: integer
keyTag:
  format: uint16
  type: integer
required:
- keyTag
- alg
- digestType
- digest
  type: object
minItems: 1
type: array
name:
  description: the zone name
  format: hostname
  type: string
required:
- name
- dsRecords
  type: object
minItems: 1
type: array
```

▼ 8.2.4. Test cases

This input parameter is used in the following test cases:

- *None specified.*

▼ 8.2.5. Test suites

This input parameter is also used in the following test suites:

- [DNS Security Extensions \(DNSSEC\)](#)
-

8.3. dnssecOps.algorithmRolloverZone

8.3.1. Description

The domain name which will be monitored for the occurrence of an algorithm rollover.

▼ 8.3.2. Example

```
{  
    "dnssecOps.algorithmRolloverZone" : "example.com"  
}
```

▼ 8.3.3. Schema

```
format: hostname  
type: string
```

▼ 8.3.4. Test cases

This input parameter is used in the following test cases:

- [dnssecOps03-AlgorithmRollover](#)

▼ 8.3.5. Test suites

This input parameter is also used in the following test suites:

- *None specified.*
-

8.4. dnssecOps.csk

8.4.1. Description

A boolean indicating whether the RSP uses a Combined Signing Key (CSK, also referred to as a “Single Type Signing Scheme”) instead of a split KSK/ZSK configuration.

▼ 8.4.2. Example

```
{  
    "dnssecOps.csk" : false  
}
```

▼ 8.4.3. Schema

```
type: boolean
```

▼ 8.4.4. Test cases

This input parameter is used in the following test cases:

- [dnssecOps01-ZSKRollover](#)

▼ 8.4.5. Test suites

This input parameter is also used in the following test suites:

- *None specified.*
-

8.5. dnssecOps.kskRolloverZone

8.5.1. Description

The domain name which will be monitored for the occurrence of a KSK rollover.

▼ 8.5.2. Example

```
{  
    "dnssecOps.kskRolloverZone" : "example.com"  
}
```

▼ 8.5.3. Schema

```
format: hostname  
type: string
```

▼ 8.5.4. Test cases

This input parameter is used in the following test cases:

- [dnssecOps02-KSKRollover](#)

▼ 8.5.5. Test suites

This input parameter is also used in the following test suites:

- *None specified.*

8.6. dnssecOps.nameservers

8.6.1. Description

The set of nameservers that will be authoritative for the zones used in the DNSSEC operations test suite.

▼ 8.6.2. Example

```
{  
    "dnssecOps.nameservers" : [  
        {  
            "name" : "ns1.example.com",  
            "v4addrs" : [  
                "192.0.2.1"  
            ],  
            "v6addrs" : [  
                "2001:DB8::53:1"  
            ]  
        },  
        {  
            "name" : "ns2.example.net",  
            "v4addrs" : [  
                "192.0.2.2"  
            ],  
            "v6addrs" : [  
                "2001:DB8::53:2"  
            ]  
        }  
    ]  
}
```

▼ 8.6.3. Schema

```
items:
  properties:
    name:
      description: The fully-qualified nameserver name.
      format: hostname
      type: string
    v4Addrs:
      description: The IPv4 address(es) for the nameserver.
      items:
        format: ipv4
        type: string
      minItems: 1
      type: array
    v6Addrs:
      description: The IPv6 address(es) for the nameserver.
      items:
        format: ipv6
        type: string
      minItems: 1
      type: array
  required:
  - name
  - addrs
  type: object
minItems: 1
type: array
```

▼ 8.6.4. Test cases

This input parameter is used in the following test cases:

- *None specified.*

▼ 8.6.5. Test suites

This input parameter is also used in the following test suites:

- [DNSSEC Operations](#)
-

8.7. dnssecOps.primaryServers

8.7.1. Description

The primary nameserver(s) from which zones can be transferred.

▼ 8.7.2. Example

```
{  
    "dnssecOps.primaryServers" : {  
        "v4Addrs" : [  
            "192.0.2.1"  
        ],  
        "v6Addrs" : [  
            "2001:DB8::53:2"  
        ]  
    }  
}
```

▼ 8.7.3. Schema

```
properties:  
    v4Addrs:  
        description: The IPv4 address(es) for the primary server(s).  
        items:  
            format: ipv4  
            type: string  
        minItems: 1  
        type: array  
    v6Addrs:  
        description: The IPv6 address(es) for the primary server(s).  
        items:  
            format: ipv6  
            type: string  
        minItems: 1  
        type: array  
    required:  
    - v4Addrs  
    - v6Addrs  
    type: object
```

▼ 8.7.4. Test cases

This input parameter is used in the following test cases:

- *None specified.*

▼ 8.7.5. Test suites

This input parameter is also used in the following test suites:

- [DNSSEC Operations](#)
-

8.8. dnssecOps.tsigKey

8.8.1. Description

The TSIG key which should be used to perform zone transfers.

▼ 8.8.2. Example

```
{  
    "dnssecOps.tsigKey" : {  
        "algorithm" : "hmac-sha256",  
        "name" : "rst-tsig-01",  
        "secret" : "cSevMti9Wj6P2i4SsK4bHRnzUkT8k/FG0UoPLZ7kYm8="  
    }  
}
```

▼ 8.8.3. Schema

```
properties:  
    algorithm:  
        description: |  
            The TSIG algorithm. The mnemonics are a subset of those published in  
            the IANA registry at  
            <https://www.iana.org/assignments/tsig-algorithm-names/tsig-algorithm-names.xhtml>.  
        enum:  
            - hmac-sha256  
            - hmac-sha384  
            - hmac-sha512  
        type: string  
    name:  
        description: The TSIG name.  
        format: hostname  
        type: string  
    secret:  
        description: The TSIG secret.  
        type: string  
    type: object
```

▼ 8.8.4. Test cases

This input parameter is used in the following test cases:

- *None specified.*

▼ 8.8.5. Test suites

This input parameter is also used in the following test suites:

- [DNSSEC Operations](#)
-

8.9. dnssecOps.zskRolloverZone

8.9.1. Description

The domain name which will be monitored for the occurrence of a ZSK rollover.

▼ 8.9.2. Example

```
{  
    "dnssecOps.zskRolloverZone" : "example.com"  
}
```

▼ 8.9.3. Schema

```
format: hostname  
type: string
```

▼ 8.9.4. Test cases

This input parameter is used in the following test cases:

- [dnssecOps01-ZSKRollover](#)

▼ 8.9.5. Test suites

This input parameter is also used in the following test suites:

- *None specified.*
-

8.10. epp.clid01

8.10.1. Description

the username used to log in to the EPP server

▼ 8.10.2. Example

```
{  
    "epp.clid01" : "clid-01"  
}
```

▼ 8.10.3. Schema

```
maxLength: 16  
minLength: 3  
type: string
```

▼ 8.10.4. Test cases

This input parameter is used in the following test cases:

- [integration-01](#)

▼ 8.10.5. Test suites

This input parameter is also used in the following test suites:

- [Extensible Provisioning Protocol \(EPP\)](#)
 - [Internationalized Domain Names \(IDN\)](#)
 - [SRS Gateway](#)
 - [Minimum Rights Protection Mechanisms \(RPMs\)](#)
-

8.11. epp.clid01DataModel

8.11.1. Description

the data model configured for this registrar. This may be omitted and will in any case be ignored unless the value of the general.registryDataModel input parameter is per-registrar.

- A value of `minimum` means that this registrar does not need to specify a registrant object when creating a domain name.
- A value of `maximum` means that this registrar **MUST** specify a registrant object when creating a domain name.

If the value of the general.registryDataModel input parameter is per-registrar, then the value of this input parameter **MUST** be different from the value of the epp.clid02DataModel input parameter.

▼ 8.11.2. Example

```
{  
    "epp.clid01DataModel" : "minimum"  
}
```

▼ 8.11.3. Schema

```
enum:  
- minimum  
- maximum  
type: string
```

▼ 8.11.4. Test cases

This input parameter is used in the following test cases:

- *None specified.*

▼ 8.11.5. Test suites

This input parameter is also used in the following test suites:

- [Extensible Provisioning Protocol \(EPP\)](#)
 - [Internationalized Domain Names \(IDN\)](#)
 - [SRS Gateway](#)
 - [Minimum Rights Protection Mechanisms \(RPMs\)](#)
-

8.12. epp.clid02

8.12.1. Description

the username used for transfer tests

▼ 8.12.2. Example

```
{  
    "epp.clid02" : "clid-02"  
}
```

▼ 8.12.3. Schema

```
maxLength: 16  
minLength: 3  
type: string
```

▼ 8.12.4. Test cases

This input parameter is used in the following test cases:

- *None specified.*

▼ 8.12.5. Test suites

This input parameter is also used in the following test suites:

- [Extensible Provisioning Protocol \(EPP\)](#)
 - [Internationalized Domain Names \(IDN\)](#)
 - [SRS Gateway](#)
 - [Minimum Rights Protection Mechanisms \(RPMs\)](#)
-

8.13. epp.clid02DataModel

8.13.1. Description

the data model configured for this registrar. This may be omitted and will in any case be ignored unless the value of the general.registryDataModel input parameter is per-registrar.

- A value of `minimum` means that this registrar does not need to specify a registrant object when creating a domain name.
- A value of `maximum` means that this registrar **MUST** specify a registrant object when creating a domain name.

If the value of the general.registryDataModel input parameter is per-registrar, then the value of this input parameter **MUST** be different from the value of the epp.clid01DataModel input parameter.

▼ 8.13.2. Example

```
{  
    "epp.clid02DataModel" : "minimum"  
}
```

▼ 8.13.3. Schema

```
enum:  
- minimum  
- maximum  
type: string
```

▼ 8.13.4. Test cases

This input parameter is used in the following test cases:

- *None specified.*

▼ 8.13.5. Test suites

This input parameter is also used in the following test suites:

- [Extensible Provisioning Protocol \(EPP\)](#)
 - [Internationalized Domain Names \(IDN\)](#)
 - [SRS Gateway](#)
 - [Minimum Rights Protection Mechanisms \(RPMs\)](#)
-

8.14. epp.greeting

8.14.1. Description

an XML instance which contains a copy of the server's <greeting>.

▼ 8.14.2. Example

```
{  
    "epp.greeting" : "greeting.xml"  
}
```

▼ 8.14.3. Schema

type: string

▼ 8.14.4. Test cases

This input parameter is used in the following test cases:

- [epp-02](#)
- [rde-13](#)

▼ 8.14.5. Test suites

This input parameter is also used in the following test suites:

- *None specified.*
-

8.15. epp.hostModel

8.15.1. Description

The host model supported by the EPP server. The possible values for this parameter are: * objects * attributes

▼ 8.15.2. Example

```
{  
    "epp.hostModel" : "objects"  
}
```

▼ 8.15.3. Schema

```
enum:  
- objects  
- attributes  
type: string
```

▼ 8.15.4. Test cases

This input parameter is used in the following test cases:

- [integration-01](#)

▼ 8.15.5. Test suites

This input parameter is also used in the following test suites:

- [Extensible Provisioning Protocol \(EPP\)](#)
 - [Internationalized Domain Names \(IDN\)](#)
 - [SRS Gateway](#)
 - [Minimum Rights Protection Mechanisms \(RPMs\)](#)
-

8.16. epp.hostName

8.16.1. Description

The fully-qualified domain name of the EPP server.

The server name **MUST** comply with the requirements for valid hostnames described in RFC 1123, section 2.1. Additionally, all IDN labels in the server name **MUST** comply with IDNA2008.

▼ 8.16.2. Example

```
{  
    "epp.hostName" : "epp.rsp.tech"  
}
```

▼ 8.16.3. Schema

```
format: hostname  
type: string
```

▼ 8.16.4. Test cases

This input parameter is used in the following test cases:

- [integration-01](#)

▼ 8.16.5. Test suites

This input parameter is also used in the following test suites:

- [Extensible Provisioning Protocol \(EPP\)](#)
 - [Internationalized Domain Names \(IDN\)](#)
 - [SRS Gateway](#)
 - [Minimum Rights Protection Mechanisms \(RPMs\)](#)
-

8.17. epp.pwd01

8.17.1. Description

the password used to log in to the EPP server

▼ 8.17.2. Example

```
{  
    "epp.pwd01" : "foo2bar"  
}
```

▼ 8.17.3. Schema

type: string

▼ 8.17.4. Test cases

This input parameter is used in the following test cases:

- [integration-01](#)

▼ 8.17.5. Test suites

This input parameter is also used in the following test suites:

- [Extensible Provisioning Protocol \(EPP\)](#)
- [Internationalized Domain Names \(IDN\)](#)
- [SRS Gateway](#)
- [Minimum Rights Protection Mechanisms \(RPMs\)](#)

8.18. epp.pwd02

8.18.1. Description

the password used for transfer tests

▼ 8.18.2. Example

```
{  
    "epp.pwd02" : "foo3bar"  
}
```

▼ 8.18.3. Schema

type: string

▼ 8.18.4. Test cases

This input parameter is used in the following test cases:

- *None specified.*

▼ 8.18.5. Test suites

This input parameter is also used in the following test suites:

- [Extensible Provisioning Protocol \(EPP\)](#)
- [Internationalized Domain Names \(IDN\)](#)
- [SRS Gateway](#)
- [Minimum Rights Protection Mechanisms \(RPMs\)](#)

8.19. epp.registeredContacts

8.19.1. Description

An array of contact IDs that exist in the EPP server and which are therefore unavailable for registration.

If the value of general.registryDataModel is maximum, or per-registrar, then this array **MUST** contain one member for each TLD in the TLD set. However, if it is minimum, the array **MUST** be empty.

▼ 8.19.2. Example

```
{  
    "epp.registeredContacts" : [  
        "abc123",  
        "def321"  
    ]  
}
```

▼ 8.19.3. Schema

```
items:  
  type: string  
type: array
```

▼ 8.19.4. Test cases

This input parameter is used in the following test cases:

- [epp-06](#)

▼ 8.19.5. Test suites

This input parameter is also used in the following test suites:

- *None specified.*
-

8.20. epp.registeredNames

8.20.1. Description

An array of domain names that exist in the EPP server and which are therefore unavailable for registration. The domains **MUST NOT** be under the sponsorship of the `epp.clid01` or `epp.clid02` registrars. The array **MUST** contain one member for each TLD in the TLD set.

▼ 8.20.2. Example

```
{  
  "epp.registeredNames" : [  
    "example.example1",  
    "example.example2"  
  ]  
}
```

▼ 8.20.3. Schema

```
items:  
  format: hostname  
  type: string  
type: array
```

▼ 8.20.4. Test cases

This input parameter is used in the following test cases:

- *None specified.*

▼ 8.20.5. Test suites

This input parameter is also used in the following test suites:

- [Extensible Provisioning Protocol \(EPP\)](#)
-

8.21. epp.registeredNameservers

8.21.1. Description

An array of host objects that exist in the EPP server and which are therefore unavailable for registration.

If the value of `epp.hostModel` is `objects`, this array **MUST** contain one member for each TLD in the TLD set. However, if it is `attributes`, the array **MUST** be empty.

▼ 8.21.2. Example

```
{  
  "epp.registeredNameservers" : [  
    "ns1.example.com",  
    "ns2.example.org"  
  ]  
}
```

▼ 8.21.3. Schema

```
items:  
  format: hostname  
  type: string  
type: array
```

▼ 8.21.4. Test cases

This input parameter is used in the following test cases:

- [epp-05](#)

▼ 8.21.5. Test suites

This input parameter is also used in the following test suites:

- *None specified.*
-

8.22. epp.requiredContactTypes

8.22.1. Description

An array containing the values of the type attribute of <contact> element(s) that are required to successfully create a domain name. If the value of general.registryDataModel is minimum, this array MUST be empty.

▼ 8.22.2. Example

```
{  
  "epp.requiredContactTypes" : [  
    "admin"  
  ]  
}
```

▼ 8.22.3. Schema

```
items:  
  enum:  
    - admin  
    - tech  
    - billing  
  type: string  
type: array
```

▼ 8.22.4. Test cases

This input parameter is used in the following test cases:

- [integration-01](#)

▼ 8.22.5. Test suites

This input parameter is also used in the following test suites:

- [Extensible Provisioning Protocol \(EPP\)](#)
 - [Internationalized Domain Names \(IDN\)](#)
 - [SRS Gateway](#)
 - [Minimum Rights Protection Mechanisms \(RPMs\)](#)
-

8.23. epp.restoreReportRequired

8.23.1. Description

Whether the server requires submission of a restore report when a client attempts to restore a domain.

▼ 8.23.2. Example

```
{  
    "epp.restoreReportRequired" : false  
}
```

▼ 8.23.3. Schema

type: boolean

▼ 8.23.4. Test cases

This input parameter is used in the following test cases:

- [epp-22](#)

▼ 8.23.5. Test suites

This input parameter is also used in the following test suites:

- *None specified.*
-

8.24. epp.secDNSInterfaces

8.24.1. Description

Which of the interfaces defined in Section 4 of RFC 5910 the server supports (either dsData or keyData).

▼ 8.24.2. Example

```
{  
    "epp.secDNSInterfaces" : "dsData"  
}
```

▼ 8.24.3. Schema

enum:
- dsData
- keyData
type: string

▼ 8.24.4. Test cases

This input parameter is used in the following test cases:

- [epp-14](#)

▼ 8.24.5. Test suites

This input parameter is also used in the following test suites:

- *None specified.*
-

8.25. epp.serverIssuedClientCertificate01

8.25.1. Description

If the EPP server uses a private CA to issue client certificates, then a certificate generated using the CSR provided in the `epp.clientCSR` resource may be provided using this parameter. This certificate will only be used in conjunction with the `epp.clid01` and `epp.pwd01` credentials. If the server will accept ICANN's own client certificate, this parameter **SHOULD** be empty.

▼ 8.25.2. Example

```
{  
    "epp.serverIssuedClientCertificate01" : "rst_test_client_cert.pem"  
}
```

▼ 8.25.3. Schema

`type: string`

▼ 8.25.4. Test cases

This input parameter is used in the following test cases:

- [integration-01](#)

▼ 8.25.5. Test suites

This input parameter is also used in the following test suites:

- [Extensible Provisioning Protocol \(EPP\)](#)
 - [Internationalized Domain Names \(IDN\)](#)
 - [SRS Gateway](#)
 - [Minimum Rights Protection Mechanisms \(RPMs\)](#)
-

8.26. epp.serverIssuedClientCertificate02

8.26.1. Description

If the EPP server uses a private CA to issue client certificates, then a certificate generated using the CSR provided in the `epp.clientCSR` resource may be provided using this parameter. This certificate will only be used in conjunction with the `epp.clid02` and `epp.pwd02` credentials. If the server will accept ICANN's own client certificate, this parameter **SHOULD** be empty.

▼ 8.26.2. Example

```
{  
    "epp.serverIssuedClientCertificate02" : "rst_test_client_cert.pem"  
}
```

▼ 8.26.3. Schema

`type: string`

▼ 8.26.4. Test cases

This input parameter is used in the following test cases:

- *None specified.*

▼ 8.26.5. Test suites

This input parameter is also used in the following test suites:

- [Extensible Provisioning Protocol \(EPP\)](#)
 - [Internationalized Domain Names \(IDN\)](#)
 - [SRS Gateway](#)
 - [Minimum Rights Protection Mechanisms \(RPMs\)](#)
-

8.27. general.registryDataModel

8.27.1. Description

This input parameter describes the data model(s) supported by the registry, determined in accordance with Section 7 of the Registration Data Policy. The possible values are:

- **minimum**: the registry does not collect registrant contact information from registrars. This policy applies to all registrars.
- **maximum**: the registry requires the transmission of registrant contact information from registrars for all registrations. This policy applies to all registrars.
- **per-registrar**: the registry may or may not require transmission of registrant contact information, depending on whether there is an appropriate legal basis, and a data processing agreement is in place between the registry operator and the registrar. Therefore, the data model is determined per-registrar rather than globally.

If the value of this parameter is **per-registrar**, then one of the registrar accounts specified by the `epp.clid01` and `epp.clid02` input parameters **MUST** be configured to use the minimum data model, and one **MUST** be configured to use the maximum data model. The `epp.clid01DataModel` and `epp.clid02DataModel` input parameters are used to identify the data model configured for each account.

▼ 8.27.2. Example

```
{  
    "general.registryDataModel" : "minimum"  
}
```

▼ 8.27.3. Schema

```
enum:  
- minimum  
- maximum  
- per-registrar  
type: string
```

▼ 8.27.4. Test cases

This input parameter is used in the following test cases:

- [integration-01](#)

▼ 8.27.5. Test suites

This input parameter is also used in the following test suites:

- [Extensible Provisioning Protocol \(EPP\)](#)
- [Internationalized Domain Names \(IDN\)](#)
- [SRS Gateway](#)
- [Minimum Rights Protection Mechanisms \(RPMs\)](#)

8.28. integration.rdeSFTPDirectory

8.28.1. Description

The directory on the SFTP server where deposit files may be found.

▼ 8.28.2. Example

```
{  
    "integration.rdeSFTPDirectory" : "/path/to/deposits"  
}
```

▼ 8.28.3. Schema

type: string

▼ 8.28.4. Test cases

This input parameter is used in the following test cases:

- [integration-03](#)

▼ 8.28.5. Test suites

This input parameter is also used in the following test suites:

- *None specified.*
-

8.29. integration.rdeSFTPHostname

8.29.1. Description

The hostname of the operator's SFTP server.

▼ 8.29.2. Example

```
{  
    "integration.rdeSFTPHostname" : "sftp.rsp.tech"  
}
```

▼ 8.29.3. Schema

format: hostname
type: string

▼ 8.29.4. Test cases

This input parameter is used in the following test cases:

- [integration-03](#)

▼ 8.29.5. Test suites

This input parameter is also used in the following test suites:

- *None specified.*
-

8.30. integration.rdeSFTPUsername

8.30.1. Description

The username that can be used to connect to the SFTP server.

▼ 8.30.2. Example

```
{  
  "integration.rdeSFTPUsername" : "icann"  
}
```

▼ 8.30.3. Schema

type: string

▼ 8.30.4. Test cases

This input parameter is used in the following test cases:

- [integration-03](#)

▼ 8.30.5. Test suites

This input parameter is also used in the following test suites:

- *None specified.*
-

8.31. integration.rriACL

8.31.1. Description

An object representing the IP addresses from which requests to the RRI will be sent.

▼ 8.31.2. Example

```
{  
    "integration.rriACL" : {  
        "v4Addrs" : [  
            "192.0.2.1",  
            "192.0.2.2"  
        ],  
        "v6Addrs" : [  
            "2001:DB8::22:1",  
            "2001:DB8::22:2"  
        ]  
    }  
}
```

▼ 8.31.3. Schema

```
properties:  
  v4Addrs:  
    items:  
      format: ipv4  
      type: string  
    minItems: 1  
    type: array  
  v6Addrs:  
    items:  
      format: ipv6  
      type: string  
    type: array  
required:  
- v4Addrs  
- v6Addrs  
type: object
```

▼ 8.31.4. Test cases

This input parameter is used in the following test cases:

- [integration-03](#)

▼ 8.31.5. Test suites

This input parameter is also used in the following test suites:

- *None specified.*
-

8.32. minimumRPMS.claimsTLD

8.32.1. Description

A TLD, or other registry-class zone, which has been configured to be in perpetual trademark claims.

▼ 8.32.2. Example

```
{  
    "minimumRPMS.claimsTLD" : "tmclaims.rsp.tech"  
}
```

▼ 8.32.3. Schema

```
format: hostname  
type: string
```

▼ 8.32.4. Test cases

This input parameter is used in the following test cases:

- *None specified.*

▼ 8.32.5. Test suites

This input parameter is also used in the following test suites:

- [Minimum Rights Protection Mechanisms \(RPMs\)](#)
-

8.33. minimumRPMS.sunriseModels

8.33.1. Description

The sunrise models supported by the EPP server. The possible values for this parameter are: * start-date * end-date * both

▼ 8.33.2. Example

```
{  
    "minimumRPMS.sunriseModels" : "start-date"  
}
```

▼ 8.33.3. Schema

```
enum:  
- start-date  
- end-date  
- both  
type: string
```

▼ 8.33.4. Test cases

This input parameter is used in the following test cases:

- *None specified.*

▼ 8.33.5. Test suites

This input parameter is also used in the following test suites:

- [Minimum Rights Protection Mechanisms \(RPMs\)](#)
-

8.34. minimumRPMS.sunriseTLD

8.34.1. Description

A TLD, or other registry-class zone, which has been configured to be in perpetual sunrise.

▼ 8.34.2. Example

```
{  
    "minimumRPMS.sunriseTLD" : "tmclaims.rsp.tech"  
}
```

▼ 8.34.3. Schema

```
format: hostname  
type: string
```

▼ 8.34.4. Test cases

This input parameter is used in the following test cases:

- *None specified.*

▼ 8.34.5. Test suites

This input parameter is also used in the following test suites:

- [Minimum Rights Protection Mechanisms \(RPMs\)](#)
-

8.35. rdap.baseURLs

8.35.1. Description

The RDAP base URL(s) for the TLD(s).

The host name component of each URL **MUST** comply with the requirements for valid hostnames described in RFC 1123, section 2.1. Additionally, all IDN labels in the host name **MUST** comply with IDNA2008.

▼ 8.35.2. Example

```
{  
    "rdap.baseURLs" : [  
        {  
            "baseURL" : "https://rdap.example.com/example/",  
            "tld" : "example"  
        }  
    ]  
}
```

▼ 8.35.3. Schema

```
items:  
  properties:  
    baseURL:  
      description: |  
        The RDAP Base URL. The URL **MUST** have trailing slash (`/`).  
      format: url  
      type: string  
    tld:  
      description: The TLD or equivalent registry-class domain name.  
      format: hostname  
      type: string  
  required:  
  - tld  
  - baseURL  
  type: object  
minItems: 1  
type: array
```

▼ 8.35.4. Test cases

This input parameter is used in the following test cases:

- [integration-01](#)

▼ 8.35.5. Test suites

This input parameter is also used in the following test suites:

- [Registration Data Access Protocol \(RDAP\)](#)
 - [SRS Gateway](#)
-

8.36. rdap.testDomains

8.36.1. Description

The domain(s) that will be queried to validate domain responses. This input parameter is an array of domain names, which **MUST** include at least one domain name for each TLD being tested.

▼ 8.36.2. Example

```
{  
    "rdap.testDomains" : [  
        "example.com",  
        "example.net"  
    ]  
}
```

▼ 8.36.3. Schema

```
items:  
    format: hostname  
    type: string  
minItems: 1  
type: array
```

▼ 8.36.4. Test cases

This input parameter is used in the following test cases:

- *None specified.*

▼ 8.36.5. Test suites

This input parameter is also used in the following test suites:

- [Registration Data Access Protocol \(RDAP\)](#)
-

8.37. rdap.testEntities

8.37.1. Description

The entities(s) that will be queried to validate entity responses. This input parameter is an array of objects. At least one entity **MUST** be provided for each TLD being tested.

▼ 8.37.2. Example

```
{  
    "rdap.testEntities" : [  
        {  
            "handle" : 9995,  
            "tld" : "example"  
        }  
    ]  
}
```

▼ 8.37.3. Schema

```
items:  
properties:  
    handle:  
        description: the entity handle.  
        type: string  
    tld:  
        description: The TLD.  
        format: hostname  
        type: string  
required:  
- tld  
- handle  
type: object  
minItems: 1  
type: array
```

▼ 8.37.4. Test cases

This input parameter is used in the following test cases:

- *None specified.*

▼ 8.37.5. Test suites

This input parameter is also used in the following test suites:

- [Registration Data Access Protocol \(RDAP\)](#)
-

8.38. rdap.testNameservers

8.38.1. Description

The nameservers(s) that will be queried to validate nameserver responses. This input parameter is an array of objects. At least one nameserver **MUST** be provided for each TLD being tested.

▼ 8.38.2. Example

```
{  
    "rdap.testNameservers" : [  
        {  
            "nameserver" : "ns1.example.com",  
            "tld" : "example1"  
        },  
        {  
            "nameserver" : "ns1.example.com",  
            "tld" : "example2"  
        }  
    ]  
}
```

▼ 8.38.3. Schema

```
items:  
  properties:  
    nameserver:  
      description: The nameserver name.  
      format: hostname  
      type: string  
    tld:  
      description: The TLD.  
      format: hostname  
      type: string  
  required:  
  - tld  
  - nameserver  
  type: object  
minItems: 1  
type: array
```

▼ 8.38.4. Test cases

This input parameter is used in the following test cases:

- *None specified.*

▼ 8.38.5. Test suites

This input parameter is also used in the following test suites:

- [Registration Data Access Protocol \(RDAP\)](#)
-

8.39. rde.depositFile

8.39.1. Description

an RDE deposit file. The TLD to which the deposit relates **MUST** match one of the TLDs that are associated with the test object.

▼ 8.39.2. Example

```
{  
    "rde.depositFile" : "example_20231004_FULL_S1_R0.ryde"  
}
```

▼ 8.39.3. Schema

type: string

▼ 8.39.4. Test cases

This input parameter is used in the following test cases:

- *None specified.*

▼ 8.39.5. Test suites

This input parameter is also used in the following test suites:

- [Registry Data Escrow \(RDE\)](#)
-

8.40. rde.publicKey

8.40.1. Description

a PGP public key block

▼ 8.40.2. Example

```
{  
    "rde.publicKey" : "rsp-rde-signing-key.asc"  
}
```

▼ 8.40.3. Schema

type: string

▼ 8.40.4. Test cases

This input parameter is used in the following test cases:

- [rde-02](#)

▼ 8.40.5. Test suites

This input parameter is also used in the following test suites:

- *None specified.*
-

8.41. rde.signatureFile

8.41.1. Description

an ASCII-armoured OpenPGP signature covering the deposit file

▼ 8.41.2. Example

```
{  
    "rde.signatureFile" : "example_20231004_FULL_S1_R0.sig"  
}
```

▼ 8.41.3. Schema

type: string

▼ 8.41.4. Test cases

This input parameter is used in the following test cases:

- [rde-02](#)

▼ 8.41.5. Test suites

This input parameter is also used in the following test suites:

- *None specified.*
-

8.42. srsgw.eppClid01

8.42.1. Description

the username used to log in to the SRS Gateway EPP server

▼ 8.42.2. Example

```
{  
    "srsgw.eppClid01" : "clid-01"  
}
```

▼ 8.42.3. Schema

minLength: 3
type: string

▼ 8.42.4. Test cases

This input parameter is used in the following test cases:

- *None specified.*

▼ 8.42.5. Test suites

This input parameter is also used in the following test suites:

- [SRS Gateway](#)
-

8.43. srsgw.eppClid02

8.43.1. Description

the username used for transfer tests

▼ 8.43.2. Example

```
{  
    "srsgw.eppClid02" : "clid-02"  
}
```

▼ 8.43.3. Schema

type: string

▼ 8.43.4. Test cases

This input parameter is used in the following test cases:

- *None specified.*

▼ 8.43.5. Test suites

This input parameter is also used in the following test suites:

- [SRS Gateway](#)
-

8.44. srsgw.eppHostName

8.44.1. Description

the fully-qualified domain name of the SRS Gateway EPP server

▼ 8.44.2. Example

```
{  
    "srsgw.eppHostName" : "epp.rsp.tech"  
}
```

▼ 8.44.3. Schema

format: hostname
type: string

▼ 8.44.4. Test cases

This input parameter is used in the following test cases:

- *None specified.*

▼ 8.44.5. Test suites

This input parameter is also used in the following test suites:

- [SRS Gateway](#)
-

8.45. srsgw.eppPwd01

8.45.1. Description

the password used to log in to the SRS Gateway EPP server

▼ 8.45.2. Example

```
{  
    "srsgw.eppPwd01" : "foo2bar"  
}
```

▼ 8.45.3. Schema

type: string

▼ 8.45.4. Test cases

This input parameter is used in the following test cases:

- *None specified.*

▼ 8.45.5. Test suites

This input parameter is also used in the following test suites:

- [SRS Gateway](#)
-

8.46. srsgw.eppPwd02

8.46.1. Description

the password used for transfer tests

▼ 8.46.2. Example

```
{  
    "srsgw.eppPwd02" : "foo3bar"  
}
```

▼ 8.46.3. Schema

type: string

▼ 8.46.4. Test cases

This input parameter is used in the following test cases:

- *None specified.*

▼ 8.46.5. Test suites

This input parameter is also used in the following test suites:

- [SRS Gateway](#)
-

8.47. srsgw.rdapBaseURLs

8.47.1. Description

The RDAP base URL(s) for the TLD(s).

The host name component of each URL **MUST** comply with the requirements for valid hostnames described in RFC 1123, section 2.1. Additionally, all IDN labels in the host name **MUST** comply with IDNA2008.

▼ 8.47.2. Example

```
{  
    "srsgw.rdapBaseURLs" : [  
        {  
            "baseURL" : "https://rdap.example.com/example/",  
            "tld" : "example"  
        }  
    ]  
}
```

▼ 8.47.3. Schema

```
items:  
  properties:  
    baseURL:  
      description: |  
        The RDAP Base URL. The URL **MUST** have trailing slash (`/`).  
      format: url  
      type: string  
    tld:  
      description: The TLD or equivalent registry-class domain name.  
      format: hostname  
      type: string  
  required:  
  - tld  
  - baseURL  
  type: object  
minItems: 1  
type: array
```

▼ 8.47.4. Test cases

This input parameter is used in the following test cases:

- *None specified.*

▼ 8.47.5. Test suites

This input parameter is also used in the following test suites:

- [SRS Gateway](#)
-

8.48. srsgw.serverIssuedClientCertificate01

8.48.1. Description

If the EPP server uses a private CA to issue client certificates, then a certificate generated using the CSR provided in the `epp.clientCSR` may be provided using this parameter. This certificate will only be used in conjunction with the `srsgw.eppClid01` and `srsgw.eppPwd01` credentials. If the server will accept ICANN's own client certificate, this parameter **SHOULD** be empty.

▼ 8.48.2. Example

```
{  
    "srsgw.serverIssuedClientCertificate01" : "cert.pem"  
}
```

▼ 8.48.3. Schema

`type: string`

▼ 8.48.4. Test cases

This input parameter is used in the following test cases:

- *None specified.*

▼ 8.48.5. Test suites

This input parameter is also used in the following test suites:

- [SRS Gateway](#)
-

8.49. srsgw.serverIssuedClientCertificate02

8.49.1. Description

If the EPP server uses a private CA to issue client certificates, then a certificate generated using the CSR provided in the `epp.clientCSR` may be provided using this parameter. This certificate will only be used in conjunction with the `srsgw.eppClid02` and `srsgw.eppPwd02` credentials. If the server will accept ICANN's own client certificate, this parameter **SHOULD** be empty.

▼ 8.49.2. Example

```
{  
    "srsgw.serverIssuedClientCertificate02" : "cert.pem"  
}
```

▼ 8.49.3. Schema

`type: string`

▼ 8.49.4. Test cases

This input parameter is used in the following test cases:

This error may be produced by the following test cases:

- [dnssec-92](#)
-

9.3. DNSSEC_INVALID_SIGNING_ALGORITHM

9.3.1. Severity

- **ERROR**

9.3.2. Description

An invalid algorithm is used to sign the zone.

▼ 9.3.3. Test cases

This error may be produced by the following test cases:

- [dnssec-91](#)
-

9.4. DNSSEC_NSEC3_ITERATIONS_IS_NOT_ZERO

9.4.1. Severity

- **ERROR**

9.4.2. Description

The iterations field of the NSEC3PARAM record is not zero.

▼ 9.4.3. Test cases

This error may be produced by the following test cases:

- [dnssec-93](#)
-

9.5. DNSSEC_NSEC3_SALT_IS_NOT_EMPTY

9.5.1. Severity

- **ERROR**

9.5.2. Description

The salt field of the NSEC3PARAM record is not zero (represented as a – in the presentation format).

▼ 9.5.3. Test cases

This error may be produced by the following test cases:

- [dnssec-93](#)
-

9.6. DNSSEC_OPS_ALGORITHM_ROLLOVER_CHAIN_OF_TRUST_BROKEN

9.6.1. Severity

- **ERROR**

9.6.2. Description

The Chain-of-Trust from the root trust anchor was broken during the algorithm rollover.

▼ 9.6.3. Test cases

This error may be produced by the following test cases:

- [dnssecOps03-AlgorithmRollover](#)
-

9.7. DNSSEC_OPS_ALGORITHM_ROLLOVER_NOT_COMPLETED

9.7.1. Severity

- **ERROR**

9.7.2. Description

The algorithm rollover was not completed within the test period.

▼ 9.7.3. Test cases

This error may be produced by the following test cases:

- [dnssecOps03-AlgorithmRollover](#)
-

9.8. DNSSEC_OPS_DNS_QUERY_FAILED_TOO_MANY_TIMES

9.8.1. Severity

- **ERROR**

9.8.2. Description

There was an error performing a DNS query.

▼ 9.8.3. Test cases

This error may be produced by the following test cases:

- [dnssecOps01-ZSKRollover](#)
 - [dnssecOps02-KSKRollover](#)
 - [dnssecOps03-AlgorithmRollover](#)
-

9.9. DNSSEC_OPS_INVALID_ALGORITHM

9.9.1. Severity

- **ERROR**

9.9.2. Description

The zone was rolled to an invalid algorithm. Please see the details of [dnssec-91](#) for more information.

▼ 9.9.3. Test cases

This error may be produced by the following test cases:

- [dnssecOps03-AlgorithmRollover](#)
-

9.10. DNSSEC_OPS_KSK_ROLLOVER_CHAIN_OF_TRUST_BROKEN

9.10.1. Severity

- **ERROR**

9.10.2. Description

The Chain-of-Trust from the root trust anchor was broken during the KSK rollover.

▼ 9.10.3. Test cases

This error may be produced by the following test cases:

- [dnssecOps02-KSKRollover](#)
-

9.11. DNSSEC_OPS_KSK_ROLLOVER_NOT_COMPLETED

9.11.1. Severity

- **ERROR**

9.11.2. Description

The KSK rollover was not completed within the test period.

▼ 9.11.3. Test cases

This error may be produced by the following test cases:

- [dnssecOps02-KSKRollover](#)
-

9.12. DNSSEC_OPS_XFR_FAILED_TOO_MANY_TIMES

9.12.1. Severity

- **ERROR**

9.12.2. Description

There was an error performing a zone transfer.

▼ 9.12.3. Test cases

This error may be produced by the following test cases:

- [dnssecOps01-ZSKRollover](#)
 - [dnssecOps02-KSKRollover](#)
 - [dnssecOps03-AlgorithmRollover](#)
-

9.13. DNSSEC_OPS_ZONE_IS_INVALID

9.13.1. Severity

- **CRITICAL**

9.13.2. Description

The zone file returned by a zone transfer request was invalid. This may be because: 1. it was not properly signed, or 2. it contained an insufficient number of resource records.

▼ 9.13.3. Test cases

This error may be produced by the following test cases:

- [dnssecOps01-ZSKRollover](#)
 - [dnssecOps02-KSKRollover](#)
 - [dnssecOps03-AlgorithmRollover](#)
-

9.14. DNSSEC_OPS_ZSK_ROLLOVER_CHAIN_OF_TRUST_BROKEN

9.14.1. Severity

- **ERROR**

9.14.2. Description

The Chain-of-Trust from the root trust anchor was broken during the ZSK rollover.

▼ 9.14.3. Test cases

This error may be produced by the following test cases:

- [dnssecOps01-ZSKRollover](#)
-

9.15. DNSSEC_OPS_ZSK_ROLLOVER_NOT_COMPLETED

9.15.1. Severity

- **ERROR**

9.15.2. Description

The ZSK rollover was not completed within the test period.

9.79. EPP_DOMAIN_CHECK_INVALID_DOMAIN_INCORRECT_AVAIL

9.79.1. Severity

- ERROR

9.79.2. Description

The server responded to a <check> command with an unexpected value in one or more of the avail attributes.

▼ 9.79.3. Test cases

This error may be produced by the following test cases:

- [epp-04](#)
-

9.80. EPP_DOMAIN_CHECK_REGISTERED_DOMAIN_INCORRECT_AVAIL

9.80.1. Severity

- ERROR

9.80.2. Description

The server responded to a <check> command with an unexpected value in one or more of the avail attributes.

▼ 9.80.3. Test cases

This error may be produced by the following test cases:

- [epp-04](#)
-

9.81. EPP_DOMAIN_CHECK_VALID_DOMAIN_INCORRECT_AVAIL

9.81.1. Severity

- **ERROR**

9.81.2. Description

The server responded to a <check> command with an unexpected value in one or more of the avail attributes.

▼ 9.81.3. Test cases

This error may be produced by the following test cases:

- [epp-04](#)
-

9.82. EPP_DOMAIN_CREATE_INFO_RESPONSE_INVALID_ROID

9.82.1. Severity

- **ERROR**

9.82.2. Description

Following a successful domain <create> command, a subsequent <info> response for the created object contained an invalid value in the <roid> element, or which has a suffix not present in the IANA registry.

▼ 9.82.3. Test cases

This error may be produced by the following test cases:

- [epp-14](#)
-

9.83. EPP_DOMAIN_CREATE_INFO_RESPONSE_MISSING_OBJECT_PROPERTIES

9.83.1. Severity

- **ERROR**

9.83.2. Description

Following a successful domain <create> command, a subsequent <info> response for the created object did not include one or more elements from the <create> command.

▼ 9.83.3. Test cases

This error may be produced by the following test cases:

- [epp-14](#)
-

9.84. EPP_DOMAIN_CREATE_SERVER_ACCEPTS_AUTHINFO

9.84.1. Severity

- **ERROR**

9.84.2. Description

The server accepts a domain <create> command with a <pw> element with an invalid value.

▼ 9.84.3. Test cases

This error may be produced by the following test cases:

- [epp-14](#)
-

9.85. EPP_DOMAIN_CREATE_SERVER_ACCEPTS_HOST_ATTRIBUTES_WITHOUT_GLUE

9.85.1. Severity

- **ERROR**

9.85.2. Description

The server accepts a domain <create> command with one or more <hostAttr> elements containing hostnames that are in-bailiwick, but for which <hostAddr> elements are not provided.

▼ 9.85.3. Test cases

This error may be produced by the following test cases:

- [epp-14](#)
-

9.86. EPP_DOMAIN_CREATE_SERVER_ACCEPTS_INVALID_DNSSEC_DATA

9.86.1. Severity

- **ERROR**

9.86.2. Description

The server accepts a domain <create> command with one or more <hostAttr> elements containing hostnames that are in-bailiwick, but for which <hostAddr> elements are not provided.

▼ 9.86.3. Test cases

This error may be produced by the following test cases:

- [epp-14](#)
-

9.87. EPP_DOMAIN_CREATE_SERVER_ACCEPTS_INVALID_DOMAIN_NAME

9.87.1. Severity

- **ERROR**

9.87.2. Description

The server accepts a domain <create> command for a syntactically invalid domain name.

▼ 9.87.3. Test cases

This error may be produced by the following test cases:

- [epp-14](#)
-

9.88. EPP_DOMAIN_CREATE_SERVER_ACCEPTS_INVALID_HOST_OBJECT

9.88.1. Severity

- **ERROR**

9.88.2. Description

The server accepts a domain <create> command which contains a <hostObj> element referencing a syntactically invalid hostname.

▼ 9.88.3. Test cases

This error may be produced by the following test cases:

- [epp-14](#)
-

9.89. EPP_DOMAIN_CREATE_SERVER_ACCEPTS_INVALID_PERIOD

9.89.1. Severity

- **ERROR**

9.89.2. Description

The server accepts a domain <create> command which contains a <period> element with an invalid content and/or unit attribute.

▼ 9.89.3. Test cases

This error may be produced by the following test cases:

- [epp-14](#)
-

9.90. EPP_DOMAIN_CREATE_SERVER_ACCEPTS_NON_EXISTENT_CONTACT_OBJECT

9.90.1. Severity

- **ERROR**

9.90.2. Description

The server accepts a domain <create> command which contains a <registrant> and/or <contact> element referencing a non-existent contact object.

▼ 9.90.3. Test cases

This error may be produced by the following test cases:

- [epp-14](#)
-

9.91. EPP_DOMAIN_CREATE_SERVER_ACCEPTS_NON_EXISTENT_HOST_OBJECT

9.91.1. Severity

- **ERROR**

9.91.2. Description

The server accepts a domain <create> command which contains a <hostObj> element referencing a non-existent host object.

▼ 9.91.3. Test cases

This error may be produced by the following test cases:

- [epp-14](#)
-

9.92. EPP_DOMAIN_CREATE_SERVER_ACCEPTS_NO_REGISTRANT_FOR_THICK_REGISTRY

9.92.1. Severity

- **ERROR**

9.92.2. Description

The server accepts a domain <create> command which does not include a <registrant> object.

▼ 9.92.3. Test cases

This error may be produced by the following test cases:

- [epp-14](#)
-

9.93. EPP_DOMAIN_CREATE_SERVER_ACCEPTS_REGISTRANT_FOR_THIN_REGISTRY

9.93.1. Severity

- **ERROR**

9.93.2. Description

The server accepts a domain <create> command which includes a <registrant> object.

▼ 9.93.3. Test cases

This error may be produced by the following test cases:

- [epp-14](#)
-

9.94. EPP_DOMAIN_CREATE_SERVER_INCORRECTLY_ACCEPTS_HOST_ATTRIBUTES

9.94.1. Severity

- **ERROR**

9.94.2. Description

The server accepts a domain <create> command which uses <hostAttr> objects.

▼ 9.94.3. Test cases

This error may be produced by the following test cases:

- [epp-14](#)
-

9.95. EPP_DOMAIN_CREATE_SERVER_INCORRECTLY_ACCEPTS_HOST_OBJECTS

9.95.1. Severity

- **ERROR**

9.95.2. Description

The server accepts a domain <create> command which uses <hostObj> objects.

▼ 9.95.3. Test cases

This error may be produced by the following test cases:

- [epp-14](#)
-

9.96. EPP_DOMAIN_DELETE_INFO_RESPONSE_OBJECT_NOT_PENDING_DELETE

9.96.1. Severity

- **ERROR**

9.96.2. Description

Following a successful domain <delete> command, which resulted in a 1001 response, the domain did not have the pendingDelete status.

▼ 9.96.3. Test cases

This error may be produced by the following test cases:

- [epp-21](#)
-

9.97. EPP_DOMAIN_DELETE_INFO_RESPONSE_OBJECT_STILL_EXISTS

9.97.1. Severity

- **ERROR**

9.97.2. Description

Following a successful domain <delete> command, which resulted in a 1000 response, a subsequent <info> command did not result in a 2303 ("Object does not exist") result code.

▼ 9.97.3. Test cases

This error may be produced by the following test cases:

- [epp-21](#)
-

9.98. EPP_DOMAIN_DELETE_INFO_RESPONSE_RGP_STATUS_NOT_PENDING_DELETE

9.98.1. Severity

- **ERROR**

9.98.2. Description

Following a successful domain <delete> command, which resulted in a 1001 response, the domain did not have the pendingDeleteRestorable RGP status.

▼ 9.98.3. Test cases

This error may be produced by the following test cases:

- [epp-21](#)
-

9.99. EPP_DOMAIN_UPDATE_INFO_RESPONSE_MISSING_DNSSEC_DATA

9.99.1. Severity

- **ERROR**

9.99.2. Description

Following a successful domain <update> command, a subsequent <info> response for the created object did not include all expected <dsData> or <keyData> elements.

▼ 9.99.3. Test cases

This error may be produced by the following test cases:

- [epp-16](#)
-

9.100. EPP_DOMAIN_UPDATE_INFO_RESPONSE_MISSING_HOST_ATTRIBUTE

9.100.1. Severity

- **ERROR**

9.100.2. Description

Following a successful domain <update> command, a subsequent <info> response for the created object did not include all expected <hostAttr> elements.

▼ 9.100.3. Test cases

This error may be produced by the following test cases:

- [epp-16](#)
-

9.101. EPP_DOMAIN_UPDATE_INFO_RESPONSE_MISSING_HOST_OBJECT

9.101.1. Severity

- **ERROR**

9.101.2. Description

Following a successful domain <update> command, a subsequent <info> response for the created object did not include all expected <hostObj> elements.

▼ 9.101.3. Test cases

This error may be produced by the following test cases:

- [epp-16](#)
-

9.102. EPP_DOMAIN_UPDATE_INFO_RESPONSE_MISSING_REGISTRANT

9.102.1. Severity

- **ERROR**

9.102.2. Description

Following a successful domain <update> command, a subsequent <info> response for the created object did not include the expected <registrant> element.

▼ 9.102.3. Test cases

This error may be produced by the following test cases:

- [epp-16](#)
-

9.103. EPP_DOMAIN_UPDATE_INFO_RESPONSE_MISSING_STATUS_CODE

9.103.1. Severity

- **ERROR**

9.103.2. Description

Following a successful domain <update> command, a subsequent <info> response for the created object did not include the expected <status> elements.

▼ 9.103.3. Test cases

This error may be produced by the following test cases:

- [epp-16](#)
-

9.104. EPP_DOMAIN_UPDATE_INFO_RESPONSE_UNEXPECTED_DNSSEC_DATA

9.104.1. Severity

- **ERROR**

9.104.2. Description

Following a successful domain <update> command, a subsequent <info> response for the created object included one or more unexpected <dsData> or <keyData> element(s).

▼ 9.104.3. Test cases

This error may be produced by the following test cases:

- [epp-16](#)
-

9.105. EPP_DOMAIN_UPDATE_INFO_RESPONSE_UNEXPECTED_HOST_ATTRIBUTE

9.105.1. Severity

- **ERROR**

9.105.2. Description

Following a successful domain <update> command, a subsequent <info> response for the created object included one or more unexpected <hostAttr> element(s).

▼ 9.105.3. Test cases

This error may be produced by the following test cases:

- [epp-16](#)
-

9.106. EPP_DOMAIN_UPDATE_INFO_RESPONSE_UNEXPECTED_HOST_OBJECT

9.106.1. Severity

- **ERROR**

9.106.2. Description

Following a successful domain <update> command, a subsequent <info> response for the created object included one or more unexpected <hostObj> element(s).

▼ 9.106.3. Test cases

This error may be produced by the following test cases:

- [epp-16](#)
-

9.107. EPP_DOMAIN_UPDATE_INFO_RESPONSE_UNEXPECTED_REGISTRANT

9.107.1. Severity

- **ERROR**

9.107.2. Description

Following a successful domain <update> command, a subsequent <info> response for the created object included an unexpected <registrant> element, or a <registrant> element containinin an unexpected value.

▼ 9.107.3. Test cases

This error may be produced by the following test cases:

- [epp-16](#)
-

9.108. EPP_DOMAIN_UPDATE_INFO_RESPONSE_UNEXPECTED_STATUS_CODE

9.108.1. Severity

- **ERROR**

9.108.2. Description

Following a successful domain <update> command, a subsequent <info> response for the created object included one or more unexpected <status> element(s).

▼ 9.108.3. Test cases

This error may be produced by the following test cases:

- [epp-16](#)
-

9.109. EPP_DOMAIN_UPDATE_SERVER_ACCEPTS_HOST_ATTRIBUTES_WITHOUT_GLUE

9.109.1. Severity

- **ERROR**

9.109.2. Description

The server accepts a domain <update> command with one or more <hostAttr> elements containing hostnames that are in-bailiwick, but for which <hostAddr> elements are not provided.

▼ 9.109.3. Test cases

This error may be produced by the following test cases:

- [epp-16](#)
-

9.110. EPP_DOMAIN_UPDATE_SERVER_ACCEPTS_INVALID_DNSSEC_DATA

9.110.1. Severity

- **ERROR**

9.110.2. Description

The server accepts a domain <update> command with one or more <dsData> or <keyData> elements which contain invalid parameters.

▼ 9.110.3. Test cases

This error may be produced by the following test cases:

- [epp-16](#)
-

9.111. EPP_DOMAIN_UPDATE_SERVER_ACCEPTS_INVALID_HOST_ATTRIBUTES

9.111.1. Severity

- **ERROR**

9.111.2. Description

The server accepts a domain <update> command with one or more <hostAttr> elements containing invalid hostnames and/or IP addresses.

▼ 9.111.3. Test cases

This error may be produced by the following test cases:

- [epp-16](#)
-

9.112. EPP_DOMAIN_UPDATE_SERVER_ACCEPTS_NON_EXISTENT_CONTACT_OBJECT

9.112.1. Severity

- **ERROR**

9.112.2. Description

The server accepts a domain <update> command which contains a <registrant> or <contact> element containing non-existent contact objects.

▼ 9.112.3. Test cases

This error may be produced by the following test cases:

- [epp-16](#)
-

9.113. EPP_DOMAIN_UPDATE_SERVER_ACCEPTS_NON_EXISTENT_HOST_OBJECT

9.113.1. Severity

- **ERROR**

9.113.2. Description

The server accepts a domain <update> command with one or more <hostObj> elements containing non-existent host objects.

▼ 9.113.3. Test cases

This error may be produced by the following test cases:

- [epp-16](#)
-

9.114. EPP_DOMAIN_UPDATE_SERVER_INCORRECTLY_ACCEPTS_HOST_ATTRIBUTES

9.114.1. Severity

- **ERROR**

9.114.2. Description

The server accepts a domain <update> command that contained one or more <hostAttr> elements, but the `epp.hostModel` input parameter is objects.

▼ 9.114.3. Test cases

This error may be produced by the following test cases:

- [epp-16](#)
-

9.115. EPP_DOMAIN_UPDATE_SERVER_INCORRECTLY_ACCEPTS_HOST_OBJECTS

9.115.1. Severity

- **ERROR**

9.115.2. Description

The server accepts a domain <update> command that contained one or more <hostAttr> elements, but the `epp.hostModel` input parameter is attributes.

▼ 9.115.3. Test cases

This error may be produced by the following test cases:

- [epp-16](#)
-

9.116. EPP_GENERIC_COMMAND_ERROR

9.116.1. Severity

- **ERROR**

9.116.2. Description

The client received a 2400 error from the server.

▼ 9.116.3. Test cases

This error may be produced by the following test cases:

- [integration-01](#)
-

9.117. EPP_GREETING_DOES_NOT_MATCH

9.117.1. Severity

- **ERROR**

9.117.2. Description

The XML instance in the `epp.greeting` input parameter does not match that returned by the server in response to a `<hello>` command.

▼ 9.117.3. Test cases

This error may be produced by the following test cases:

- [epp-02](#)
-

9.118. EPP_GREETING_INVALID_LANG

9.118.1. Severity

- **ERROR**

9.118.2. Description

The value of one or more of the `<lang>` elements in the `<greeting>` are invalid.

▼ 9.118.3. Test cases

This error may be produced by the following test cases:

- [epp-02](#)
-

9.119. EPP_GREETING_MISSING_EN_LANG

9.119.1. Severity

- **ERROR**

9.119.2. Description

A `<lang>` element with the value en was not found in the `<greeting>`.

▼ 9.119.3. Test cases

This error may be produced by the following test cases:

- [epp-02](#)
-

9.120. EPP_GREETING_MISSING_EXTURI

9.120.1. Severity

- **ERROR**

9.120.2. Description

A mandatory extension namespace URI is missing.

▼ 9.120.3. Test cases

This error may be produced by the following test cases:

- [epp-02](#)
-

9.121. EPP_GREETING_MISSING_OBJURI

9.121.1. Severity

- **ERROR**

9.121.2. Description

A mandatory object namespace URI is missing.

▼ 9.121.3. Test cases

This error may be produced by the following test cases:

- [epp-02](#)
-

9.122. EPP_GREETING_RECOMMENDED_EXTENSION_MISSING

9.122.1. Severity

- **WARNING**

9.122.2. Description

The server does not include the namespace URI of a recommended extension in an <extURI> element of the <greeting> frame.

▼ 9.122.3. Test cases

This error may be produced by the following test cases:

- [epp-02](#)
-

9.123. EPP_GREETING_SVDATE_INVALID

9.123.1. Severity

- **ERROR**

9.123.2. Description

The value of the <svDate> element in the <greeting> is invalid.

▼ 9.123.3. Test cases

This error may be produced by the following test cases:

- [epp-02](#)
-

9.124. EPP_GREETING_SVID_INVALID

9.124.1. Severity

- **ERROR**

9.124.2. Description

The value of the <svID> element in the <greeting> is invalid.

▼ 9.124.3. Test cases

This error may be produced by the following test cases:

- [epp-02](#)
-

9.125. EPP_GREETING_UNEXPECTED_EXTURI

9.125.1. Severity

- **ERROR**

9.125.2. Description

One or more of the <extRI> elements in the <greeting> contain invalid namespace URIs.

▼ 9.125.3. Test cases

This error may be produced by the following test cases:

- [epp-02](#)
-

9.126. EPP_GREETING_UNEXPECTED_OBJURI

9.126.1. Severity

- **ERROR**

9.126.2. Description

One or more of the <objURI> elements in the <greeting> contain invalid namespace URIs.

▼ 9.126.3. Test cases

This error may be produced by the following test cases:

- [epp-02](#)
-

9.127. EPP_GREETING_VERSION_INVALID

9.127.1. Severity

- **ERROR**

9.127.2. Description

The value of the <version> element in the <greeting> is invalid.

▼ 9.127.3. Test cases

This error may be produced by the following test cases:

- [epp-02](#)
-

9.128. EPP_HOST_CHECK_INVALID_HOST_INCORRECT_AVAIL

9.128.1. Severity

- **ERROR**

9.128.2. Description

The server responded to a <check> command with an unexpected value in one or more of the avail attributes.

▼ 9.128.3. Test cases

This error may be produced by the following test cases:

- [epp-05](#)
-

9.129. EPP_HOST_CHECK_REGISTERED_HOST_INCORRECT_AVAIL

9.129.1. Severity

- **ERROR**

9.129.2. Description

The server responded to a <check> command with an unexpected value in one or more of the avail attributes.

▼ 9.129.3. Test cases

This error may be produced by the following test cases:

- [epp-05](#)
-

9.130. EPP_HOST_CHECK_VALID_HOST_INCORRECT_AVAIL

9.130.1. Severity

- **ERROR**

9.130.2. Description

The server responded to a <check> command with an unexpected value in one or more of the avail attributes.

▼ 9.130.3. Test cases

This error may be produced by the following test cases:

- [epp-05](#)
-

9.131. EPP_HOST_CREATE_INFO_RESPONSE_MISSING_OBJECT_PROPERTIES

9.131.1. Severity

- **ERROR**

9.131.2. Description

Following a successful host <create> command, a subsequent <info> response for the created object did not include one or more elements from the <create> command.

▼ 9.131.3. Test cases

This error may be produced by the following test cases:

- [epp-11](#)
-

9.132. EPP_HOST_CREATE_INFO_RESPONSE_OBJECT_DOES_NOT_EXIST

9.132.1. Severity

- **ERROR**

9.132.2. Description

Following a successful host <create> command, a subsequent <info> command for the created object returned a 2303 “Object does not exist” result code.

▼ 9.132.3. Test cases

This error may be produced by the following test cases:

- [epp-11](#)
-

9.133. EPP_HOST_CREATE_SERVER_ACCEPTS_INVALID_HOSTNAME

9.133.1. Severity

- **ERROR**

9.133.2. Description

The server accepts a host <create> command with a <name> element that contains a syntactically invalid hostname.

▼ 9.133.3. Test cases

This error may be produced by the following test cases:

- [epp-11](#)
-

9.134. EPP_HOST_CREATE_SERVER_ACCEPTS_INVALID_IPV4_ADDRESS

9.134.1. Severity

- **ERROR**

9.134.2. Description

The server accepts a host <create> command with a <addr> element that contains a syntactically invalid IPv4 address.

▼ 9.134.3. Test cases

This error may be produced by the following test cases:

- [epp-11](#)
-

9.135. EPP_HOST_CREATE_SERVER_ACCEPTS_INVALID_IPv6_ADDRESS

9.135.1. Severity

- **ERROR**

9.135.2. Description

The server accepts a host <create> command with a <addr> element that contains a syntactically invalid IPv6 address.

▼ 9.135.3. Test cases

This error may be produced by the following test cases:

- [epp-11](#)
-

9.136. EPP_HOST_DELETE_INFO_RESPONSE_OBJECT_STILL_EXISTS

9.136.1. Severity

- **ERROR**

9.136.2. Description

Following a successful host <delete> command, a subsequent <info> command for the created object did not return a 2303 “Object does not exist” result code.

▼ 9.136.3. Test cases

This error may be produced by the following test cases:

- [epp-24](#)
-

9.137. EPP_HOST_RENAME_SERVER_ACCEPTS_INVALID_HOSTNAME

9.137.1. Severity

- **ERROR**

9.137.2. Description

The server accepts a host <update> command with a <name> element that contains a syntactically invalid hostname.

▼ 9.137.3. Test cases

This error may be produced by the following test cases:

- [epp-23](#)

9.138. EPP_HOST_RENAME_SERVER_ACCEPTS_RENAME_TO_ANOTHER_REGISTRARS_DOMAIN

9.138.1. Severity

- **ERROR**

9.138.2. Description

The server accepts a host <update> command with a <name> element that contains a hostname that is subordinate to a domain under the sponsorship of another registrar.

▼ 9.138.3. Test cases

This error may be produced by the following test cases:

- [epp-23](#)
-

9.139. EPP_HOST_RENAME_SERVER_ACCEPTS_RENAME_TO_NONEXISTENT_DOMAIN

9.139.1. Severity

- **ERROR**

9.139.2. Description

The server accepts a host <update> command with a <name> element that contains a hostname that is subordinate to a non-existent domain.

▼ 9.139.3. Test cases

This error may be produced by the following test cases:

- [epp-23](#)
-

9.140. EPP_HOST_RENAME_SERVER_REJECTS_OUT_OF_BAILIWICK_NAME

9.140.1. Severity

- **ERROR**

9.140.2. Description

The server rejects a host <update> command with a <name> element that contains a hostname that is out-of-bailiwick.

▼ 9.140.3. Test cases

This error may be produced by the following test cases:

- [epp-23](#)
-

9.141. EPP_HOST_RENAME_SERVER_UNEXPECTEDLY_REJECTS_RENAME

9.141.1. Severity

- **ERROR**

9.141.2. Description

The server rejects a host <update> command with a <name> element that it should have accepted.

▼ 9.141.3. Test cases

This error may be produced by the following test cases:

- [epp-23](#)
-

9.142. EPP_HOST_UPDATE_AUTHZ_ERROR

9.142.1. Severity

- **ERROR**

9.142.2. Description

The server rejects a host <update> command for a host object that is not under the sponsorship of the connected client.

▼ 9.142.3. Test cases

This error may be produced by the following test cases:

- [epp-12](#)
-

9.143. EPP_HOST_UPDATE_INFO_RESPONSE_MISSING_OBJECT_PROPERTIES

9.143.1. Severity

- **ERROR**

9.143.2. Description

Following a successful host <update> command, a subsequent <info> response for the created object did not include one or more elements from the <update> command.

▼ 9.143.3. Test cases

This error may be produced by the following test cases:

- [epp-13](#)
-

9.144. EPP_HOST_UPDATE_INFO_RESPONSE_OBJECT_DOES_NOT_EXIST

9.144.1. Severity

- **ERROR**

9.144.2. Description

Following a successful host <update> command, a subsequent <info> command for the created object unexpectedly returned a 2303 “Object does not exist” result code.

▼ 9.144.3. Test cases

This error may be produced by the following test cases:

- [epp-13](#)
-

9.145. EPP_HOST_UPDATE_SERVER_ACCEPTS_INVALID_IPV4_ADDRESS

9.145.1. Severity

- **ERROR**

9.145.2. Description

The server accepts a host <update> command with an <addr> element that contains a syntactically invalid IPv4 address.

▼ 9.145.3. Test cases

This error may be produced by the following test cases:

- [epp-13](#)
-

9.146. EPP_HOST_UPDATE_SERVER_ACCEPTS_INVALID_IPv6_ADDRESS

9.146.1. Severity

- **ERROR**

9.146.2. Description

The server accepts a host <update> command with an <addr> element that contains a syntactically invalid IPv6 address.

▼ 9.146.3. Test cases

This error may be produced by the following test cases:

- [epp-13](#)
-

9.147. EPP_HOST_UPDATE_SERVER_ACCEPTS_INVALID_STATUS_CODE

9.147.1. Severity

- **ERROR**

9.147.2. Description

The server accepts a host <update> command with a <status> element that contains an invalid status code in the s attribute.

▼ 9.147.3. Test cases

This error may be produced by the following test cases:

- [epp-13](#)
-

9.148. EPP_INTEGRITY_SERVER_ACCEPTS_DELETE_FOR_LINKED_CONTACT_OBJECT

9.148.1. Severity

- **ERROR**

9.148.2. Description

The server accepts a <delete> command for a contact object that has the linked status.

▼ 9.148.3. Test cases

This error may be produced by the following test cases:

- [epp-15](#)
-

9.149. EPP_INTEGRITY_SERVER_ACCEPTS_DELETE_FOR_LINKED_HOST_OBJECT

9.149.1. Severity

- **ERROR**

9.149.2. Description

The server accepts a <delete> command for a host object that has the linked status.

▼ 9.149.3. Test cases

This error may be produced by the following test cases:

- [epp-15](#)
-

9.150. EPP_LOGIN_ERROR

9.150.1. Severity

- CRITICAL

9.150.2. Description

The client was unable to successfully authenticate with the EPP server.

▼ 9.150.3. Test cases

This error may be produced by the following test cases:

- [epp-04](#)
- [epp-05](#)

9.151. EPP_LOGIN_UNEXPECTEDLY_FAILED

9.151.1. Severity

- **ERROR**

9.151.2. Description

The client was not able to authenticate with the provided credentials.

▼ 9.151.3. Test cases

This error may be produced by the following test cases:

- [epp-03](#)
-

9.152. EPP_LOGIN_UNEXPECTEDLY_SUCCEEDED

9.152.1. Severity

- **ERROR**

9.152.2. Description

A <login> command that should have failed unexpectedly succeeded.

▼ 9.152.3. Test cases

This error may be produced by the following test cases:

- [epp-03](#)
-

9.153. EPP_MISSING_AAAA_RECORDS

9.153.1. Severity

- **WARNING**

9.153.2. Description

No AAAA record(s) were found for the EPP server hostname.

▼ 9.153.3. Test cases

This error may be produced by the following test cases:

- [epp-01](#)
-

9.154. EPP_MISSING_A_RECORDS

9.154.1. Severity

- **CRITICAL**

9.154.2. Description

No A record(s) were found for the EPP server hostname.

▼ 9.154.3. Test cases

This error may be produced by the following test cases:

- [epp-01](#)
-

9.155. EPP_NO_GREETING_RECEIVED

9.155.1. Severity

- **ERROR**

9.155.2. Description

No <greeting> was received after successful connection.

▼ 9.155.3. Test cases

This error may be produced by the following test cases:

- [epp-02](#)
-

9.156. EPP_NO_SERVICE_PORTS_REACHABLE

9.156.1. Severity

- **CRITICAL**

9.156.2. Description

No service ports could be reached, for either IPv4 or (if supported) IPv6.

9.186.1. Severity

- **ERROR**

9.186.2. Description

The server rejects a <create> command with a <name> object containing a **valid** label.

▼ 9.186.3. Test cases

This error may be produced by the following test cases:

- [idn-01](#)
-

9.187. IDN_VARIANT_LABEL_NOT_BLOCKED

9.187.1. Severity

- **ERROR**

9.187.2. Description

A variant label remains available for registration.

▼ 9.187.3. Test cases

This error may be produced by the following test cases:

- [idn-02](#)
-

9.188. IDN_VARIANT_SERVER_ACCEPTS_VARIANT_CREATE_FROM_INCORRECT_REGISTRAR

9.188.1. Severity

- **ERROR**

9.188.2. Description

The server accepts a <create> command for a variant of an existing domain from a registrar other than that of the original domain.

▼ 9.188.3. Test cases

This error may be produced by the following test cases:

- [idn-03](#)
 - [idn-04](#)
-

9.189. IDN_VARIANT_SERVER_ACCEPTS_VARIANT_CREATE_WITH_INCORRECT_REGISTRANT

9.189.1. Severity

- **ERROR**

9.189.2. Description

The server accepts a <create> command for a variant of an existing domain from with a registrant other than that the original domain.

▼ 9.189.3. Test cases

This error may be produced by the following test cases:

- [idn-03](#)
 - [idn-04](#)
-

9.190. IDN_VARIANT_SERVER_REJECTS_VARIANT_CREATE_FROM_SAME_REGISTRAR

9.190.1. Severity

- **ERROR**

9.190.2. Description

The server rejects a <create> command for a variant of an existing domain from the registrar of the original domain.

▼ 9.190.3. Test cases

This error may be produced by the following test cases:

- [idn-03](#)
 - [idn-04](#)
-

9.191. IDN_VARIANT_SERVER_REJECTS_VARIANT_CREATE_WITH_SAME_REGISTRANT

9.191.1. Severity

- **ERROR**

9.191.2. Description

The server rejects a <create> command for a variant of an existing domain using the same registrant as of the original domain.

▼ 9.191.3. Test cases

This error may be produced by the following test cases:

- [idn-03](#)
 - [idn-04](#)
-

9.192. INTEGRATION_DNS_QUERY_FAILED

9.192.1. Severity

- **WARNING**

9.192.2. Description

A DNS query failed. Persistent errors may result in the test failing if the expected resource records are not observed within the Service Level Requirement.

▼ 9.192.3. Test cases

This error may be produced by the following test cases:

- [integration-02](#)
-

9.193. INTEGRATION_DOMAIN_NOT_PRESENT_IN_DNS

9.193.1. Severity

- **ERROR**

9.193.2. Description

One or more expected DNS records were not observed within the Service Level Requirement. This may be due to recurrent errors performing DNS queries, or because the DNS server(s) did not respond with the expected resource records.

▼ 9.193.3. Test cases

This error may be produced by the following test cases:

- [integration-02](#)
-

9.194. INTEGRATION_DOMAIN_NOT_PRESENT_IN_RDAP

9.194.1. Severity

- **ERROR**

9.194.2. Description

One or more expected RDAP responses were not observed within the Service Level Requirement. This may be due to recurrent errors performing RDAP queries, or because the RDAP server(s) did not respond with the expected responses.

▼ 9.194.3. Test cases

This error may be produced by the following test cases:

- [integration-01](#)
-

9.195. INTEGRATION_DOMAIN_NOT_PRESENT_IN_RDE

9.195.1. Severity

- **ERROR**

9.195.2. Description

One or more expected RDE objects were not observed within the Service Level Requirement. This may be due to recurrent errors accessing the SFTP server, because the deposit file(s) could not be found, or because the objects were not present in those files.

▼ 9.195.3. Test cases

This error may be produced by the following test cases:

- [integration-03](#)
-

9.196. INTEGRATION_RDAP_REQUEST_FAILED

9.196.1. Severity

- **WARNING**

9.196.2. Description

An RDAP query failed. Persistent errors may result in the test failing if the expected resource records are not observed within the Service Level Requirement.

▼ 9.196.3. Test cases

This error may be produced by the following test cases:

- [integration-01](#)
-

9.197. INTEGRATION_RDE_SFTP_SERVER_AUTHENTICATION_ERROR

9.197.1. Severity

- **WARNING**

9.197.2. Description

There was an issue authenticating with the SFTP server. Persistent errors may result in the test failing if the expected objects are not observed in a valid deposit within the Service Level Requirement.

▼ 9.197.3. Test cases

This error may be produced by the following test cases:

- [integration-03](#)
-

9.198. INTEGRATION_RDE_SFTP_SERVER_UNREACHABLE

9.198.1. Severity

- **WARNING**

9.198.2. Description

There was an issue connecting to the SFTP server. Persistent errors may result in the test failing if the expected objects are not observed in a valid deposit within the Service Level Requirement.

9.327. SRSGW_EPP_CONTACT_DELETE_OBJECT_STILL_EXISTS

9.327.1. Severity

- **ERROR**

9.327.2. Description

Following a successful contact <delete> command, the object was not purged from the primary EPP server within the deadline.

▼ 9.327.3. Test cases

This error may be produced by the following test cases:

- [srsgw-12](#)
-

9.328. SRSGW_EPP_CONTACT_UPDATE_FAILED

9.328.1. Severity

- **ERROR**

9.328.2. Description

The contact <update> command at the SRS Gateway EPP server failed.

▼ 9.328.3. Test cases

This error may be produced by the following test cases:

- [srsgw-11](#)
-

9.329. SRSGW_EPP_CONTACT_UPDATE_INFO_RESPONSES_DIFFER

9.329.1. Severity

- **ERROR**

9.329.2. Description

Following a successful contact <update> command, the <info> response from the primary EPP server was not updated within the deadline.

▼ 9.329.3. Test cases

This error may be produced by the following test cases:

- [srsgw-11](#)
-

9.330. SRSGW_EPP_HOST_DELETE_FAILED

9.330.1. Severity

- **ERROR**

9.330.2. Description

The host <delete> command at the SRS Gateway EPP server failed.

▼ 9.330.3. Test cases

This error may be produced by the following test cases:

- [srgw-10](#)
-

9.331. SRSGW_EPP_HOST_DELETE_OBJECT_STILL_EXISTS

9.331.1. Severity

- **ERROR**

9.331.2. Description

Following a successful host <delete> command, the object was not purged from the primary EPP server within the deadline.

▼ 9.331.3. Test cases

This error may be produced by the following test cases:

- [srgw-10](#)
-

9.332. SRSGW_EPP_HOST_UPDATE_FAILED

9.332.1. Severity

- **CRITICAL**

9.332.2. Description

The host <update> command at the SRS Gateway EPP server failed.

▼ 9.332.3. Test cases

This error may be produced by the following test cases:

- [srgw-09](#)
-

9.333. SRSGW_EPP_HOST_UPDATE_INFO_RESPONSES_DIFFER

9.333.1. Severity

- **ERROR**

9.333.2. Description

Following a successful host <update> command, the <info> response from the primary EPP server was not updated within the deadline.

▼ 9.333.3. Test cases

This error may be produced by the following test cases:

- [srsgw-09](#)
-

9.334. SRSGW_HOST_CREATE_FAILED

9.334.1. Severity

- **CRITICAL**

9.334.2. Description

The host <create> command at the SRS Gateway EPP server failed.

▼ 9.334.3. Test cases

This error may be produced by the following test cases:

- [srsgw-02](#)
-

9.335. SRSGW_HOST_CREATE_OBJECT_HAS_MISSING_OR_INVALID_PROPERTIES

9.335.1. Severity

- **ERROR**

9.335.2. Description

Following a successful host <create> command, the <info> response from the SRS Gateway EPP server has missing or invalid object properties.

▼ 9.335.3. Test cases

This error may be produced by the following test cases:

- [srsgw-02](#)
-

9.336. SRSGW_HOST_CREATE_OBJECT_NOT_FOUND_WITHIN_DEADLINE

9.336.1. Severity

- **ERROR**

9.336.2. Description

Following a successful host <create> command, the primary EPP server did not respond with a successful <info> response within the deadline.

▼ 9.336.3. Test cases

This error may be produced by the following test cases:

- [srsgw-02](#)
-

9.337. SRSGW_RDAP_DNS_RESOLUTION_ERROR

9.337.1. Severity

- **ERROR**

9.337.2. Description

None of the RDAP base URL(s) could be resolved.

▼ 9.337.3. Test cases

This error may be produced by the following test cases:

- [srsgw-13](#)
 - [srsgw-14](#)
 - [srsgw-15](#)
-

9.338. SRSGW_RDAP_QUERY_FAILED

9.338.1. Severity

- **ERROR**

9.338.2. Description

The RDAP query resulted in an unexpected response (HTTP status, media type, etc).

▼ 9.338.3. Test cases

This error may be produced by the following test cases:

- [srsgw-13](#)
 - [srsgw-14](#)
 - [srsgw-15](#)
-

9.339. SRSGW_RDAP_RESPONSES_DIFFER

9.339.1. Severity

- **ERROR**

9.339.2. Description

The responses from the SRS Gateway and Primary RDAP servers differ.

▼ 9.339.3. Test cases

This error may be produced by the following test cases:

- [srsgw-13](#)
 - [srsgw-14](#)
 - [srsgw-15](#)
-

9.340. SRSGW_RDAP_SERVICE_PORT_UNREACHABLE

9.340.1. Severity

- **ERROR**

9.340.2. Description

None of the RDAP service ports could be reached.

▼ 9.340.3. Test cases

This error may be produced by the following test cases:

- [srsgw-13](#)
 - [srsgw-14](#)
 - [srsgw-15](#)
-

9.341. SRSGW_RDAP_TLS_CONNECTION_ERROR

9.341.1. Severity

- **ERROR**

9.341.2. Description

A TLS connection could not be established to the service port.

▼ 9.341.3. Test cases

This error may be produced by the following test cases:

- [srsgw-13](#)
 - [srsgw-14](#)
 - [srsgw-15](#)
-

9.342. ZM_AAAA_BAD_RDATA

9.342.1. Severity

- ERROR

9.342.2. Description

Zonemaster describes this error as follows:> Nameserver {ns} answered AAAA query with an unexpected RDATA length ({length} instead of 16).more information about this error, please refer to [the documentation for the test case this error comes from](#).

- **WARNING**

9.385.2. Description

Zonemaster describes this error as follows:> DNSKEY with tag {keytag} and using algorithm {algo_num} ({algo_descr}) has a size ({keysize}) smaller than the recommended one ({keysizerec}).more information about this error, please refer to [the documentation for the test case this error comes from](#).

▼ 9.385.3. Test cases

This error may be produced by the following test cases:

- [dnssec-14](#)
-

9.386. ZM_DNSKEY_TOO_LARGE_FOR_ALGO

9.386.1. Severity

- **ERROR**

9.386.2. Description

Zonemaster describes this error as follows:> DNSKEY with tag {keytag} and using algorithm {algo_num} ({algo_descr}) has a size ({keysize}) larger than the maximum one ({keysizemax}).more information about this error, please refer to [the documentation for the test case this error comes from](#).

▼ 9.386.3. Test cases

This error may be produced by the following test cases:

- [dnssec-14](#)
-

9.387. ZM_DNSKEY_TOO_SMALL_FOR_ALGO

9.387.1. Severity

- **ERROR**

9.387.2. Description

Zonemaster describes this error as follows:> DNSKEY with tag {keytag} and using algorithm {algo_num} ({algo_descr}) has a size ({keysize}) smaller than the minimum one ({keysizemin}).more information about this error, please refer to [the documentation for the test case this error comes from](#).

▼ 9.387.3. Test cases

This error may be produced by the following test cases:

- [dnssec-14](#)
-

9.388. ZM_DS01_DS_ALGO_2_MISSING

9.388.1. Severity

- **ERROR**

9.388.2. Description

Zonemaster describes this error as follows:> No DS record created by digest algorithm 2 (SHA-256) is present for zone {domain}.more information about this error, please refer to [the documentation for the test case this error comes from](#).

▼ 9.388.3. Test cases

This error may be produced by the following test cases:

- [dnssec-01](#)
-

9.389. ZM_DS01_DS_ALGO_DEPRECATED

9.389.1. Severity

- **ERROR**

9.389.2. Description

Zonemaster describes this error as follows:> DS record for zone {domain} with keytag {keytag} was created by digest algorithm {ds_algo_num} ({ds_algo_mnemo}) which is deprecated. Fetched from the nameservers with IP addresses "{ns_ip_list}”.more information about this error, please refer to [the documentation for the test case this error comes from](#).

▼ 9.389.3. Test cases

This error may be produced by the following test cases:

- [dnssec-01](#)
-

9.390. ZM_DS01_DS_ALGO_NOT_DS

9.390.1. Severity

- **ERROR**

9.390.2. Description

Zonemaster describes this error as follows:> DS record for zone {domain} with keytag {keytag} was created by digest algorithm {ds_algo_num} ({ds_algo_mnemo}) which is not meant for DS. Fetched from the nameservers with IP addresses "{ns_ip_list}”.more information about this error, please refer to [the documentation for the test case this error comes from](#).

▼ 9.390.3. Test cases

This error may be produced by the following test cases:

- [dnssec-01](#)
-

9.391. ZM_DS01_DS_ALGO_RESERVED

9.391.1. Severity

- **ERROR**

9.391.2. Description

Zonemaster describes this error as follows:> DS record for zone {domain} with keytag {keytag} was created with an unassigned digest algorithm (algorithm number {ds_algo_num}). Fetched from the nameservers with IP addresses "{ns_ip_list}”.more information about this error, please refer to [the documentation for the test case this error comes from](#).

▼ 9.391.3. Test cases

This error may be produced by the following test cases:

- [dnssec-01](#)
-

9.392. ZM_DS02_DNSKEY_NOT_FOR_ZONE_SIGNING

9.392.1. Severity

- **ERROR**

9.392.2. Description

Zonemaster describes this error as follows:> Flags field of DNSKEY record with tag {keytag} has not ZONE bit set although DS with same tag is present in parent. Fetched from the nameservers with IP addresses "{ns_ip_list}”.more information about this error, please refer to [the documentation for the test case this error comes from](#).

▼ 9.392.3. Test cases

This error may be produced by the following test cases:

- [dnssec-02](#)
-

9.393. ZM_DS02_DNSKEY_NOT_SEP

9.393.1. Severity

- **ERROR**

9.393.2. Description

Zonemaster describes this error as follows:> Flags field of DNSKEY record with tag {keytag} has not SEP bit set although DS with same tag is present in parent. Fetched from the nameservers with IP addresses “{ns_ip_list}”.more information about this error, please refer to [the documentation for the test case this error comes from](#).

▼ 9.393.3. Test cases

This error may be produced by the following test cases:

- [dnssec-02](#)
-

9.394. ZM_DS02_DNSKEY_NOT_SIGNED_BY_ANY_DS

9.394.1. Severity

- **ERROR**

9.394.2. Description

Zonemaster describes this error as follows:> The DNSKEY RRset has not been signed by any DNSKEY matched by a DS record. Fetched from the nameservers with IP addresses “{ns_ip_list}”.more information about this error, please refer to [the documentation for the test case this error comes from](#).

▼ 9.394.3. Test cases

This error may be produced by the following test cases:

- [dnssec-02](#)
-

9.395. ZM_DS02_NO_DNSKEY_FOR_DS

9.395.1. Severity

- **ERROR**

9.395.2. Description

Zonemaster describes this error as follows:> The DNSKEY record with tag {keytag} that the DS refers to does not exist in the DNSKEY RRset. Fetched from the nameservers with IP “{ns_ip_list}”.more information about this error, please refer to [the documentation for the test case this error comes from](#).

▼ 9.395.3. Test cases

This error may be produced by the following test cases:

- [dnssec-02](#)
-

9.396. ZM_DS02_NO_MATCHING_DNSKEY_RRSIG

9.396.1. Severity

- **ERROR**

9.396.2. Description

Zonemaster describes this error as follows:> The DNSKEY RRset is not signed by the DNSKEY with tag {keytag} that the DS record refers to. Fetched from the nameservers with IP “{ns_ip_list}”.more information about this error, please refer to [the documentation for the test case this error comes from](#).

▼ 9.396.3. Test cases

This error may be produced by the following test cases:

- [dnssec-02](#)
-

9.397. ZM_DS02_NO_MATCH_DS_DNSKEY

9.397.1. Severity

- **ERROR**

9.397.2. Description

Zonemaster describes this error as follows:> The DS record does not match the DNSKEY with tag {keytag} by algorithm or digest. Fetched from the nameservers with IP “{ns_ip_list}”.more information about this error, please refer to [the documentation for the test case this error comes from](#).

▼ 9.397.3. Test cases

This error may be produced by the following test cases:

- [dnssec-02](#)
-

9.398. ZM_DS02_NO_VALID_DNSKEY_FOR_ANY_DS

9.398.1. Severity

- **ERROR**

9.398.2. Description

Zonemaster describes this error as follows:> There is no valid DNSKEY matched by any of the DS records. Fetched from the nameservers with IP addresses “{ns_ip_list}”.more information about this error, please refer to [the documentation for the test case this error comes from](#).

▼ 9.398.3. Test cases

This error may be produced by the following test cases:

- [dnssec-02](#)
-

9.399. ZM_DS02_RRSIG_NOT_VALID_BY_DNSKEY

9.399.1. Severity

- **ERROR**

9.399.2. Description

Zonemaster describes this error as follows:> The DNSKEY RRset is signed with an RRSIG with tag {keytag} which cannot be validated by the matching DNSKEY. Fetched from the nameservers with IP addresses “{ns_ip_list}”.more information about this error, please refer to [the documentation for the test case this error comes from](#).

▼ 9.399.3. Test cases

This error may be produced by the following test cases:

- [dnssec-02](#)
-

9.400. ZM_DS08_DNSKEY_RRSIG_EXPIRED

9.400.1. Severity

- **ERROR**

9.400.2. Description

Zonemaster describes this error as follows:> RRSIG with keytag {keytag} and covering type DNSKEY has already expired. Fetched from the nameservers with IP addresses “{ns_ip_list}”.more information about this error, please refer to [the documentation for the test case this error comes from](#).

▼ 9.400.3. Test cases

This error may be produced by the following test cases:

- [dnssec-08](#)
-

9.401. ZM_DS08_DNSKEY_RRSIG_NOT_YET_VALID

9.401.1. Severity

- **ERROR**

9.401.2. Description

Zonemaster describes this error as follows:> RRSIG with keytag {keytag} and covering type DNSKEY has inception date in the future. Fetched from the nameservers with IP addresses “{ns_ip_list}”.more information about this error, please refer to [the documentation for the test case this error comes from](#).

- ERROR

9.435.2. Description

Zonemaster describes this error as follows:> Nameserver {ns} is a recursor.more information about this error, please refer to [the documentation for the test case this error comes from](#).

▼ 9.435.3. Test cases

This error may be produced by the following test cases:

- [dns-nameserver01](#)
-

9.436. ZM_IS_NOT_AUTHORITATIVE

9.436.1. Severity

- WARNING

9.436.2. Description

Zonemaster describes this error as follows:> Nameserver {ns} response is not authoritative on {proto} port 53.more information about this error, please refer to [the documentation for the test case this error comes from](#).

▼ 9.436.3. Test cases

This error may be produced by the following test cases:

- [dns-delegation04](#)
-

9.437. ZM_MISSING_OPT_IN_TRUNCATED

9.437.1. Severity

- ERROR

9.437.2. Description

Zonemaster describes this error as follows:> Nameserver {ns} replies on an EDNS query with a truncated response without EDNS.more information about this error, please refer to [the documentation for the test case this error comes from](#).

▼ 9.437.3. Test cases

This error may be produced by the following test cases:

- [dns-nameserver13](#)
-

9.438. ZM_MNAME_DISCOURAGED_DOUBLE_DASH

9.438.1. Severity

- **WARNING**

9.438.2. Description

Zonemaster describes this error as follows:> SOA MNAME (`{domain}`) has a label (`{label}`) with a double hyphen ('–') in position 3 and 4 (with a prefix which is not 'xn–').more information about this error, please refer to [the documentation for the test case this error comes from](#).

▼ 9.438.3. Test cases

This error may be produced by the following test cases:

- [dns-syntax07](#)
-

9.439. ZM_MNAME_HAS_NO_ADDRESS

9.439.1. Severity

- **WARNING**

9.439.2. Description

Zonemaster describes this error as follows:> No IP address found for SOA 'mname' nameserver (`{mname}`).more information about this error, please refer to [the documentation for the test case this error comes from](#).

▼ 9.439.3. Test cases

This error may be produced by the following test cases:

- [dns-zone07](#)
-

9.440. ZM_MNAME_NON_ALLOWED_CHARS

9.440.1. Severity

- **WARNING**

9.440.2. Description

Zonemaster describes this error as follows:> Found illegal characters in SOA MNAME (`{domain}`).more information about this error, please refer to [the documentation for the test case this error comes from](#).

▼ 9.440.3. Test cases

This error may be produced by the following test cases:

- [dns-syntax07](#)
-

9.441. ZM_MNAME_NUMERIC_TLD

9.441.1. Severity

- **WARNING**

9.441.2. Description

Zonemaster describes this error as follows:> SOA MNAME ({domain}) within a 'numeric only' TLD ({tld}).more information about this error, please refer to [the documentation for the test case this error comes from](#).

▼ 9.441.3. Test cases

This error may be produced by the following test cases:

- [dns-syntax07](#)
-

9.442. ZM_MULTIPLE_NS_SET

9.442.1. Severity

- **ERROR**

9.442.2. Description

Zonemaster describes this error as follows:> Found {count} NS set(s).more information about this error, please refer to [the documentation for the test case this error comes from](#).

▼ 9.442.3. Test cases

This error may be produced by the following test cases:

- [dns-consistency04](#)
-

9.443. ZM_MULTIPLE_SOA

9.443.1. Severity

- **ERROR**

9.443.2. Description

Zonemaster describes this error as follows:> Nameserver {ns} responds with multiple ({count}) SOA records on SOA queries.more information about this error, please refer to [the documentation for the test case this error comes from](#).

▼ 9.443.3. Test cases

This error may be produced by the following test cases:

- [dns-zone10](#)
-

9.444. ZM_MULTIPLE_SOA_MNAMES

9.444.1. Severity

- **ERROR**

9.444.2. Description

Zonemaster describes this error as follows:> Saw {count} SOA mname.more information about this error, please refer to [the documentation for the test case this error comes from](#).

▼ 9.444.3. Test cases

This error may be produced by the following test cases:

- [dns-consistency06](#)
-

9.445. ZM_MULTIPLE_SOA_RNAMES

9.445.1. Severity

- **ERROR**

9.445.2. Description

Zonemaster describes this error as follows:> Found {count} SOA rname(s).more information about this error, please refer to [the documentation for the test case this error comes from](#).

▼ 9.445.3. Test cases

This error may be produced by the following test cases:

- [dns-consistency02](#)
-

9.446. ZM_MULTIPLE_SOA_TIME_PARAMETER_SET

9.446.1. Severity

- **ERROR**

9.446.2. Description

Zonemaster describes this error as follows:> Found {count} SOA time parameter set(s).more information about this error, please refer to [the documentation for the test case this error comes from](#).

▼ 9.446.3. Test cases

This error may be produced by the following test cases:

- [dns-consistency03](#)
-

9.447. ZM_N10_EDNS_RESPONSE_ERROR

9.447.1. Severity

- **ERROR**

9.447.2. Description

Zonemaster describes this error as follows:> Expected RCODE but received erroneous response to an EDNS version 1 query.

Fetched from the nameservers with IP addresses {ns_ip_list}more information about this error, please refer to [the documentation for the test case this error comes from](#).

▼ 9.447.3. Test cases

This error may be produced by the following test cases:

- [dns-nameserver10](#)
-

9.448. ZM_N10_NO_RESPONSE_EDNS1_QUERY

9.448.1. Severity

- **ERROR**

9.448.2. Description

Zonemaster describes this error as follows:> No response to an EDNS version 1 query. Fetched from the nameservers with IP addresses {ns_ip_list}more information about this error, please refer to [the documentation for the test case this error comes from](#).

▼ 9.448.3. Test cases

This error may be produced by the following test cases:

- [dns-nameserver10](#)
-

9.449. ZM_N10_UNEXPECTED_RCODE

9.449.1. Severity

- **ERROR**

9.449.2. Description

Zonemaster describes this error as follows:> Erroneous RCODE (“{rcode}”) in response to an EDNS version 1 query. Fetched from the nameservers with IP addresses {ns_ip_list}more information about this error, please refer to [the documentation for the test case this error comes from](#).

▼ 9.449.3. Test cases

This error may be produced by the following test cases:

- [dns-nameserver10](#)
-

9.450. ZM_N11_NO_EDNS

9.450.1. Severity

- **ERROR**

9.450.2. Description

Zonemaster describes this error as follows:> The DNS response, on query with unknown EDNS option-code, does not contain any EDNS from name servers “{ns_ip_list}”.more information about this error, please refer to [the documentation for the test case this error comes from](#).

▼ 9.450.3. Test cases

This error may be produced by the following test cases:

- [dns-nameserver11](#)
-

9.451. ZM_N11_NO_RESPONSE

9.451.1. Severity

- **ERROR**

9.451.2. Description

Zonemaster describes this error as follows:> There is no response on query with unknown EDNS option-code from name servers “{ns_ip_list}”.more information about this error, please refer to [the documentation for the test case this error comes from](#).

▼ 9.451.3. Test cases

This error may be produced by the following test cases:

- [dns-nameserver11](#)
-

9.452. ZM_N11 RETURNS UNKNOWN OPTION_CODE

9.452.1. Severity

- **ERROR**

9.452.2. Description

Zonemaster describes this error as follows:> The DNS response contains an unknown EDNS option-code. Returned from name servers “{ns_ip_list}”.more information about this error, please refer to [the documentation for the test case this error comes from](#).

▼ 9.452.3. Test cases

This error may be produced by the following test cases:

- [dns-nameserver11](#)
-

9.453. ZM_N11_UNEXPECTED_ANSWER_SECTION

9.453.1. Severity

- **ERROR**

9.453.2. Description

Zonemaster describes this error as follows:> The DNS response, on query with unknown EDNS option-code, does not contain the expected SOA record in the answer section from name servers “{ns_ip_list}”.more information about this error, please refer to [the documentation for the test case this error comes from](#).

▼ 9.453.3. Test cases

This error may be produced by the following test cases:

- [dns-nameserver11](#)
-

9.454. ZM_N11_UNEXPECTED_RCODE

9.454.1. Severity

- **ERROR**

9.454.2. Description

Zonemaster describes this error as follows:> The DNS response, on query with unknown EDNS option-code, has unexpected RCODE name “{rcode}” from name servers “{ns_ip_list}”.more information about this error, please refer to [the documentation for the test case this error comes from](#).

▼ 9.454.3. Test cases

This error may be produced by the following test cases:

- [dns-nameserver11](#)
-

9.455. ZM_N11_UNSET_AA

9.455.1. Severity

- **ERROR**

9.455.2. Description

Zonemaster describes this error as follows:> The DNS response, on query with unknown EDNS option-code, is unexpectedly not authoritative from name servers “{ns_ip_list}”.more information about this error, please refer to [the documentation for the test case this error comes from](#).

▼ 9.455.3. Test cases

This error may be produced by the following test cases:

- [dns-nameserver11](#)
-

9.456. ZM_NAMESERVER_IP_PRIVATE_NETWORK

9.456.1. Severity

- CRITICAL

9.456.2. Description

Zonemaster describes this error as follows:> Nameserver {nsname} has an IP address ({ns_ip}) with prefix {prefix} referenced in {reference} as a '{name}'.more information about this error, please refer to [the documentation for the test case this error comes from](#).

▼ 9.456.3. Test cases

This error may be produced by the following test cases:

- [dns-address01](#)
-

9.457. ZM_NAMESERVER_IP_WITHOUT_REVERSE

9.457.1. Severity

- WARNING

9.457.2. Description

Zonemaster describes this error as follows:> Nameserver {nsname} has an IP address ({ns_ip}) without PTR configured.more information about this error, please refer to [the documentation for the test case this error comes from](#).

▼ 9.457.3. Test cases

This error may be produced by the following test cases:

- [dns-address02](#)
 - [dns-address03](#)
-

9.458. ZM_NOT_ENOUGH_IPV4_NS_CHILD

9.458.1. Severity

- ERROR

9.458.2. Description

Zonemaster describes this error as follows:> Child does not list enough ({count}) nameservers ({nsname_list}) that resolve to IPv4 addresses ({ns_ip_list}). Lower limit set to {minimum}.more information about this error, please refer to [the documentation for the test case this error comes from](#).

▼ 9.458.3. Test cases

This error may be produced by the following test cases:

- [dns-delegation01](#)
-

9.459. ZM_NOT_ENOUGH_IPV4_NS_DEL

9.459.1. Severity

- **ERROR**

9.459.2. Description

Zonemaster describes this error as follows:> Delegation does not list enough (`{count}`) nameservers (`{nsname_list}`) that resolve to IPv4 addresses (`{ns_ip_list}`). Lower limit set to `{minimum}`.more information about this error, please refer to [the documentation for the test case this error comes from](#).

▼ 9.459.3. Test cases

This error may be produced by the following test cases:

- [dns-delegation01](#)
-

9.460. ZM_NOT_ENOUGH_IPV6_NS_CHILD

9.460.1. Severity

- **ERROR**

9.460.2. Description

Zonemaster describes this error as follows:> Child does not list enough (`{count}`) nameservers (`{nsname_list}`) that resolve to IPv6 addresses (`{ns_ip_list}`). Lower limit set to `{minimum}`.more information about this error, please refer to [the documentation for the test case this error comes from](#).

▼ 9.460.3. Test cases

This error may be produced by the following test cases:

- [dns-delegation01](#)
-

9.461. ZM_NOT_ENOUGH_IPV6_NS_DEL

9.461.1. Severity

- **ERROR**

9.461.2. Description

Zonemaster describes this error as follows:> Delegation does not list enough (`{count}`) nameservers (`{nsname_list}`) that resolve to IPv6 addresses (`{ns_ip_list}`). Lower limit set to `{minimum}`.more information about this error, please refer to [the documentation for the test case this error comes from](#).

▼ 9.461.3. Test cases

This error may be produced by the following test cases:

- [dns-delegation01](#)
-

9.462. ZM_NOT_ENOUGH_NS_CHILD

9.462.1. Severity

- **ERROR**

9.462.2. Description

Zonemaster describes this error as follows:> Child does not list enough (`{count}`) nameservers (`{nsname_list}`). Lower limit set to `{minimum}`.more information about this error, please refer to [the documentation for the test case this error comes from](#).

▼ 9.462.3. Test cases

This error may be produced by the following test cases:

- [dns-delegation01](#)
-

9.463. ZM_NOT_ENOUGH_NS_DEL

9.463.1. Severity

- **ERROR**

9.463.2. Description

Zonemaster describes this error as follows:> Parent does not list enough (`{count}`) nameservers (`{nsname_list}`). Lower limit set to `{minimum}`.more information about this error, please refer to [the documentation for the test case this error comes from](#).

▼ 9.463.3. Test cases

This error may be produced by the following test cases:

- [dns-delegation01](#)
-

9.464. ZM_NO_DNSKEY

9.464.1. Severity

- **ERROR**

9.464.2. Description

Zonemaster describes this error as follows:> No DNSKEYs were returned.more information about this error, please refer to [the documentation for the test case this error comes from](#).

- **ERROR**

9.489.2. Description

Zonemaster describes this error as follows:> RRSIG with keytag {keytag} and covering type(s) {types} has already expired (expiration is: {expiration}).more information about this error, please refer to [the documentation for the test case this error comes from](#).

▼ 9.489.3. Test cases

This error may be produced by the following test cases:

- [dnssec-04](#)
-

9.490. ZM_SAME_IP_ADDRESS

9.490.1. Severity

- **ERROR**

9.490.2. Description

Zonemaster describes this error as follows:> IP {ns_ip} refers to multiple nameservers ({nsname_list}).more information about this error, please refer to [the documentation for the test case this error comes from](#).

▼ 9.490.3. Test cases

This error may be produced by the following test cases:

- [dns-delegation02](#)
-

9.491. ZM_TOO_MANY_ITERATIONS

9.491.1. Severity

- **WARNING**

9.491.2. Description

Zonemaster describes this error as follows:> The number of NSEC3 iterations is {count}, which is too high for key length {keylength}.more information about this error, please refer to [the documentation for the test case this error comes from](#).

▼ 9.491.3. Test cases

This error may be produced by the following test cases:

- [dnssec-03](#)
-

9.492. ZM_TOTAL_NAME_MISMATCH

9.492.1. Severity

- **ERROR**

9.492.2. Description

Zonemaster describes this error as follows:> None of the nameservers listed at the parent are listed at the child.more information about this error, please refer to [the documentation for the test case this error comes from](#).

▼ 9.492.3. Test cases

This error may be produced by the following test cases:

- [dns-delegation07](#)
-

9.493. ZM_UNEXPECTED_RCODE

9.493.1. Severity

- **WARNING**

9.493.2. Description

Zonemaster describes this error as follows:> Nameserver {ns} answered query with an unexpected rcode ({rcode}).more information about this error, please refer to [the documentation for the test case this error comes from](#).

▼ 9.493.3. Test cases

This error may be produced by the following test cases:

- [dns-delegation05](#)
-

9.494. ZM_WRONG_SOA

9.494.1. Severity

- **ERROR**

9.494.2. Description

Zonemaster describes this error as follows:> Nameserver {ns} responds with a wrong owner name ({owner} instead of {name}) on SOA queries.more information about this error, please refer to [the documentation for the test case this error comes from](#).

▼ 9.494.3. Test cases

This error may be produced by the following test cases:

- [dns-zone10](#)
-

9.495. ZM_Z_FLAGS_NOTCLEAR

9.495.1. Severity

- **ERROR**

9.495.2. Description

Zonemaster describes this error as follows:> Nameserver {ns} has one or more unknown EDNS Z flag bits set.more information about this error, please refer to [the documentation for the test case this error comes from](#).

▼ 9.495.3. Test cases

This error may be produced by the following test cases:

- [dns-nameserver12](#)
-

10. About this document

This document was automatically generated from the formal specification for the RST service, which is available in [YAML](#) and [JSON](#) formats. The YAML file is the normative reference, other representations are informational only.
